Baluchistan (JBNHS 31: 706). Winters in Pakistan, Nepal (Paynter, specimens in Yale Peabody Mus.) and northern India south to northern Maharashtra (Nasik). Affects dry scrub-covered hillsides (summer); damp areas, meadows, pasture land, fallow fields and tamarisk jungle (winter).

Extralimital. Adjacent parts of Afghanistan, Turkistan north to Lake Baikal, and western Siberia to the Urals. Winters south to Egypt and

TURDINAE

1697. Indian Collared Bush Chat. *Saxicola torquata indica* (Blyth)

Pratincola indica Blyth, 1847, Jour. Asiat. Soc. Bengal 16: 129
 (India = Calcutta)
 Baker, FBI No. 495 (part), Vol. 2: 28

Plate 91, fig. 2

LOCAL NAMES. *Dofa tirio* (Kashmir); *Mendio piddo* (Gujarati); *Khārpiddā* (Hindi, Monghyr); *Adavi-campa-nalanchi*, *Adavi-campa-jilla* (Telugu); *Rob line* (Munda).

SIZE. Sparrow —; length c. 13 cm (5 in.).

FIELD CHARACTERS. Male (adult) summer. Above, black except for white rump and white wing-patch. Below, throat black. A large white patch on sides of neck and breast (the 'collar'). Breast rufous-chestnut paling to buff on belly.

In summer plumage looks strongly pied — black and white — sometimes deceptively like Pied Bush Chat (1700) in the distance. In winter, feathers of upperparts broadly edged with rufous brown, and white feathers of rump tipped with rust colour.

Female. Above, rufous-brown streaked with dark brown. A white wing-patch. Rump pale rufous; tail blackish brown. Below, pale fulvous, rufous on breast.

STATUS, DISTRIBUTION AND HABITAT. Common summer (breeding) visitor to N. Baluchistan, and the Himalayas from Gilgit and Kashmir east to Arunachal Pradesh (Stevens, JBNHS 23: 257); also North Cachar (JBNHS 9: 130) and Nagaland (*Nidification* 2: 21). Breeds mostly between 1500 and 2500 m, locally up to 3000 m; in Nepal down to the duns (Biswas, JBNHS 58: 666). Winters from c. 2200 m down to the foothills and south through the Peninsula to southern Karnataka, east through the Bhutan foothills, Jalpaiguri duars, Bangladesh and Assam. In summer affects open country, terraced cultivation, pastures and sparsely scrubbed grassy hillsides. In winter frequents reed-beds bordering tanks, tamarisk jungle and sparse scrub on stony wasteland and around fallow fields; also sea-holly and other bushes on dry mudflats along tidal creeks, and on sand-dunes by seashore.

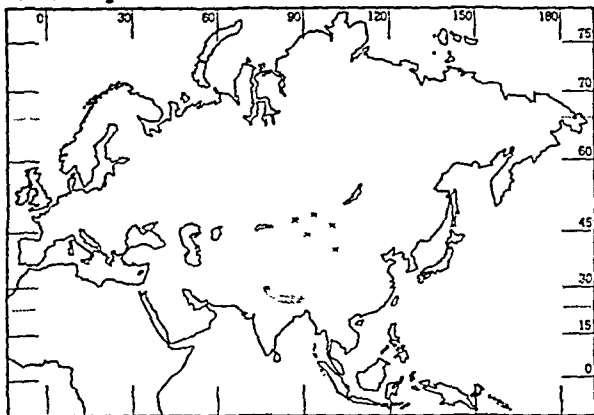

MIGRATION. Occurs in winter quarters from September to early April and on summer grounds from March to September or October. Passage in northern India noted in September and April.

GENERAL HABITS. Keeps singly or in pairs. Usually seen perched on top of a low bush making short descents to the ground for insects, returning to the same perch or flying low to another. Also catches insects in the air. Tail constantly flicked open and jerked loosely up and down.

FOOD. Chiefly ants and small beetles (Hingston); also locusts and other insects and larvae.

VOICE AND CALLS. A short but lively song often mixed with mimicked calls of other birds; delivered from a perch or in slow display flight with wings 'clapping' over back as in a pigeon but noiselessly (SA), or while flying up in the air to a height of some four to six metres and then sailing down with wings outspread (Bates & Lowther). Song period in Nepal, end of March till end of June (Proud). Alarm-notes rendered as *check-check*, and *pet-tack*.

BREEDING. Season, March to July; at least two broods. Nest, a cup of grass, moss, fibres and rootlets, lined with hair, fur and a few feathers;

Saxicola insignis

Winter range

Summer records

MIGRATION. Arrives in October (first date 27) leaves in March or early April (last date 10).

GENERAL HABITS. Solitary. A typical bush chat in habits, perching on top of bushes and descending to the ground for insects. Appears to feed mostly on the ground, not flycatching as other bush chats often do.

FOOD. Insects (mostly beetles) and their larvae; also some vegetable matter.

VOICE AND CALLS. Alarm-note, a metallic *teek teek*.

BREEDING. Extralimital.

MUSEUM DIAGNOSIS. See Field Characters.

 Th. Vög. 2: 46, pl. 4 (Kansu)
 Baker, FBI No. 496, Vol. 2: 30

Plate 91, fig. 3

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 13 cm (5 in.).

FIELD CHARACTERS. As in 1697, q.v. See Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Winter visitor. The Himalayan foothills from Kangra in Himachal Pradesh (c. 76°E.) to Arunachal Pradesh and Assam (Sadiya) south to the Ganges river, Meghalaya and Nagaland (SDR); in the hills up to c. 1300 m. Affects high grass, paddyfields, etc. as *indica*.

Extralimital. Breeds in Tibet and in the mountains of western China.

MIGRATION. Arrives in September, leaves in March. Abundant on passage in the high Himalayas in September and October (Ladakh — Meinertzhagen; Spiti — Koelz; Nepal — Diesselhorst, Polunin); on Mt Everest up to 5100 m (*Ibis* 1922: 511); 'Thousands passed through Nepal Valley between 5 and 14 April. No large scale passage in autumn' (subspecies presumed. Proud, JBNHS 48: 702); also in southeastern Tibet (Ludlow, *Ibis* 1937: 268, given as '*indica*').

GENERAL HABITS AND VOICE. As in 1697.

FOOD. Insects and their larvae, occasionally berries (GD).

BREEDING. Extralimital.

MUSEUM DIAGNOSIS. Larger than other races and darker, especially below. Axillaries black with only obsolete white tips.

MEASUREMENTS

	Wing	Bill (from skull)	Tail
♂ ♂	71-76	15-17	53-57 mm
♀ ♀	68-73	16-17	51-54 mm (BB)

Weight 8 ♂♂ (Sept.-Dec.) 13.1-17.8; 10 ♀♀ (Sept.-Dec.) 13-15.5 g (RAP, GD).

COLOURS OF BARE PARTS. As in 1697.

placed on the ground at the foot of a bush, in a hollow in grassy banks, or in piled-stone boundary walls in terraced cultivation; sometimes a little above the ground among dense vegetation. Eggs, 4 or 5, pale greyish blue, marked with faint, pale reddish spots forming a ring around the large end. Average size of 93 eggs 17.3 × 13.5 mm (Osmaston), of 100 eggs 16.9 × 13.5 mm (Baker). Incubation apparently by female alone; period c. 13 days. Often brood-parasitized by *Cuculus canorus*.

MUSEUM DIAGNOSIS. See Key to the Subspecies. First-winter male may be found in two phases of plumage: either indistinguishable from female though tending to be slightly darker, or similar to adult male except that primary-coverts, primaries and secondaries and narrow rectrices of juvenal plumage are retained (HW). No spring moult.

MEASUREMENTS

1698. East Siberian Collared Bush Chat. *Saxicola torquata stejnegeri* (Parrot)

Pr.(atincola) rubicola Stejnegeri Parrot, 1908, Verh. Orn. Ges. Bayern 8: 124 (Etorofu = Iturup [Kuriles], and Hokkaido) Baker, FBI No. 497, Vol. 2: 30

LOCAL NAMES. None recorded.
SIZE. Sparrow —; length c. 13 cm (5 in.).
FIELD CHARACTERS. As in 1697, q.v. See Museum Diagnosis.
STATUS, DISTRIBUTION AND HABITAT. Winter visitor to Assam west to the Bhutan foothills and Jalpaiguri duars, and the hills of Bangladesh south to the Chittagong region. Birds from the Andamans, where it is rare (cf. Abdulali, JBNHS 61: 564), may better be assigned to this subspecies. Habitat as in 1697.

Extralimital. Breeds in eastern Asia from the Yenisey to Manchuria, Japan and Kuriles. Winters in southeast Asia south to the Malay Peninsula and Borneo, east to the Philippines.

MIGRATION. Recorded in Assam from the end of August to the end of April (Stevens, JBNHS 30: 67).

GENERAL HABITS, FOOD AND VOICE. As in 1697.

BREEDING. Extralimital.
MUSEUM DIAGNOSIS. Darker above than *maura* or *indica* but paler than *przevalskii*, with a stouter bill. Base of tail usually black in males. Second primary (as.) usually longer than seventh.

in winter only), the Gangetic plain in Bihar, northern Bengal, northern and eastern Bangladesh, the plains of the Brahmaputra, Cachar and Manipur. Breeding range does not overlap that of *S. torquata*. Recorded in winter from Peshawar and Orissa. Essentially a bird of the plains, barely reaching c. 700 m in the foothills. Affects high grass, reeds and tamarisks on damp or inundated ground, especially in the vicinity of large rivers. Appears to be confined to areas subject to seasonal inundation.

Extralimital. Burma lowlands.

GENERAL HABITS. As in 1697. Usually perches on top of some high grass, reed or bush descending to the ground for insects. When perched moves tail slowly up and down, at the same time fanning it rapidly, exposing the white on the lateral rectrices. Generally quite shy. When approached, drops off its perch and darts away unseen through the grass. Found singly or in loose parties of 4 or 5; pairs form in February.

FOOD. Insects.
VOICE AND CALLS. Alarm-note given as *peep-cha-a*. Song 'short and lark-like' (Bell *apud* Ticehurst, *Ibis* 1922: 630).

BREEDING. Season, March to May, before the summer floods. Probably double-brooded. Nest, similar to that of *torquata*, usually well concealed in a heap of dead tamarisk leaves, under a clod, among the roots of a grass tussock or in a tangled mass of grass brought down by floods and stranded; almost always found near water. For breeding purposes prefers 4- or 5-foot high vegetation rather than tall grass or reeds. Eggs, normally 3, similar to those of *torquata* but as a whole rather more reddish. Average size of 24 eggs 18 × 14 mm (Baker).

MUSEUM DIAGNOSIS. See Key to the Species. For details of plumages see *Ibis* 1922: 20, or Baker, loc. cit. Female has the upperparts uniform earthy grey-brown without any rufous tinge; upper tail-coverts grey-brown, not rufescent as in *torquata*. Tail uniform pale brown, paler than in *torquata*. Some males breed in female-like plumage.

LOCAL NAMES. *Piddi* (Sind, Hindi); *Kālā piddā* (Hindi).
SIZE. Sparrow —; length c. 13 cm (5 in.).
FIELD CHARACTERS. Male (adult). Above, jet black with a white wing-patch and white upper tail-coverts. Below, black with white belly and under tail-coverts. In winter the black feathers are fringed with brown. White wing- and rump-patches very conspicuous in flight. Female. Above, lores buff; head and back brown. Wing brown with buff edges. Upper tail-coverts rusty. Tail blackish brown. Below, fulvous, breast and belly tinged with rusty; vent and under tail-coverts buff.

STATUS, DISTRIBUTION AND HABITAT. Partial migrant, fairly common. Pakistan and northern India, from Baluchistan, N.W.F.P. and Kashmir,

Distributional ranges 1 rossorum (RE) 2 bicolor (1700) 3 burmanica (1701) 4 nilgiriensis (1702) 5 atrata (1703)

THRUSHES AND CHATS

33

east through Punjab, Uttar Pradesh, Nepal and Bihar to northern Bengal; in the hills normally up to c. 1500 m, in Nepal locally up to c. 2100 m. In the more northern parts and at higher levels, mostly a summer (breeding) visitor, arriving in February or March, leaving in September or October; however, may be found as high as 1400 m in winter. Recorded as a winter visitor from Gujarat (including Kutch and Kathiawar), Madhya Pradesh, Maharashtra, northern Karnataka and Andhra Pradesh. A winter record from Gilgit (Scully). Affects cultivated fields about villages, sparsely scrubbed hillsides, tamarisk growth, reeds and coarse grass in the neighbourhood of tanks, canals, jheels and cultivation.

Extralimital. The species extends west to Aral Sea and eastern Iran, and east to the Philippines, Indonesia (except Borneo) and New Guinea.

GENERAL HABITS. Usually seen singly, but invariably with its mate somewhere near at hand, perched on a bush-top, weed stalk or telegraph wire, tail twitched open now and then; darts to the ground from time to time to pick up a creeping morsel or sometimes makes aerial sallies after flying insects. Very territorial, actively resisting intrusion into its feeding as well as breeding area by its own species or other chats.

Display. Flies up in the air with tail spread widely, wings flapping slowly and deliberately ('delayed action') and held high above the head, or sails slowly downwards in an arc to another perch with outspread wings, the white wing-patches and rump feathers conspicuously fluffed out, singing the while. Also displays before his mate by crouching on the perch, wings and tail outspread, singing loudly. During threat display, wings are drooped flaunting the white patches 'menacingly', tail depressed and spread, rump fluffed out and neck stiffly craned forward to the accompaniment of excited snatches of song (SA).

FOOD. Ants, beetles, larvae and some vegetable matter (Hingston); also grasshoppers and other insects, and spiders.

VOICE AND CALLS. Alarm-note, a harsh *chek-chek* ending in a subdued musical *truel*. Has a short whistling song beginning with a double *chick-chick*, recalling that of the Indian Robin and the Crested Bunting; rendered as 'we are tea for two' (highest note on *tea*) — Holmes & Wright. Uttered from a perch, occasionally a roof-top, tail depressed, wings partly drooping at the sides, displaying the white patches. In his excitement the singing bird sometimes takes short ludicrous leaps of a metre or so in the air and returns to the same perch. Song also given in display flight, q.v.

BREEDING. Season, overall March to August, in the northern parts usually not beginning before April; double-brooded. *Nest*, a cup of grass and rootlets lined with finer grass and hair; placed on the ground, under tufts of grass, in holes in walls or in the sides of wells, or in hollows in banks. *Eggs*, 3 to 5, pale blue, marked mostly at the broad end with deep reddish brown blotches and freckles. Average size of 100 eggs 17.6 × 13.9 mm (Baker). Building of nest and care of young by both sexes. Incubation chiefly by female; period 12/13 days. Often brood-parasitized by *Cuculix canorus*.

MUSEUM DIAGNOSIS. Differs from *atrata* (1703) in being smaller and having the white of underparts extending well on to the abdomen and lower breast.

THRUSHES AND CHATS

35

FIELD CHARACTERS. As in 1700, q.v.

STATUS, DISTRIBUTION AND HABITAT. Common resident. The hills of southern India from the Nilgiris southward, chiefly above 900 m, commonest at c. 1500 m. Affects grassy hillsides sparsely interspersed with dwarf wild date-palms (*Phoenix*) or 'nelli' trees (*Emblia*).

GENERAL HABITS, FOOD AND VOICE. As in 1700.

BREEDING. Season, February to May. *Nest* and *eggs* as in 1700. Average size of 50 eggs 19.5 × 15.2 mm (Baker).

MUSEUM DIAGNOSIS. Differs from *atrata* (1703) in having a smaller bill, but larger than in *burmanica*.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail

♀♀	69-75	15-16	25-26	59-63 mm

(SA)

COLOURS OF BARE PARTS. Iris brown. Bill, legs, feet and claws brownish black. Mouth yellowish pink, greyish pink or brownish pink, apparently varying with age.

1703. Ceylon Pied Bush Chat. *Saxicola caprata atrata* (Kelaart)

Pratincola atrata Kelaart, 1851, in Blyth, Jour. Asiat. Soc. Bengal 20: 177 (Newera Elia, Ceylon)

Baker, FBI No. 493 (part), Vol. 2: 25

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 13 cm (5 in.).

FIELD CHARACTERS. As in 1700, q.v.

STATUS, DISTRIBUTION AND HABITAT. Common resident. The hills of Sri Lanka above c. 1000 m, mostly on the drier side. Affects open, grassy areas with scattered bushes.

GENERAL HABITS AND FOOD. As in 1700.

VOICE AND CALLS. Alarm-note, a sharp, scolding *chuh* 'like scraping a quill against sandpaper'. Song, a brisk whistle, *chip chep-chee-eechu*. Young, when beginning to fend for themselves, utter a curious, rasping chirp *creek, creek* (Henry).

BREEDING. Season, end of February to May. *Nest* and *eggs* as in 1700. For details see Phillips, 1939, p. 254.

MUSEUM DIAGNOSIS. Differs from *nilgiriensis* (1702) in having a longer and coarser bill.

SIZE. Sparrow; length c. 15 cm (6 in.).

FIELD CHARACTERS. Male. *Above*, entirely glossy black. *Below*, entirely white.

Female. *Above*, brown tinged with rufous, especially on rump. *Below*, throat white, rest of underparts pale fulvous, darkest on breast and flanks.

STATUS, DISTRIBUTION AND HABITAT. Resident, subject to short seasonal movements; locally common. Arunachal Pradesh, Assam, Meghalaya,

Saxicola jerdoni

▨ Distributional range

Nagaland, Manipur, Mizoram, Tripura and Bangladesh, west to Bengal and eastern Bihar (Purneah). Affects the vast expanses of *ekra* grass in the plains and foothills up to c. 700 m.

Extralimital. Extends east through Burma and northern Laos to northern Vietnam.

GENERAL HABITS. Typical of the bush chats. Keeps singly or in pairs; usually very shy. Perches on reed-stems or bushes, darting to the ground for insects, sometimes foraging among the rootstocks of grass and reeds. The tail is constantly expanded and flirled.

FOOD. Insects.

THRUSHES AND CHATS

37

VOICE and CALLS. A very silent bird. Only note recorded is a low *chit-churr*, and a *chirrr* of alarm (Baker).

BREEDING. *Season*, February to end of May. *Nest*, a cup of rootlets and fine grass lined with same but finer material; placed on the ground, among the roots of a grass tuft or in a hollow in a bank. *Eggs*, normally 4, less often 3, deep turquoise, unspotted. Average size of 30 eggs 16.2 × 13.3 mm (Baker). Incubation apparently by female alone.

MUSEUM DIAGNOSIS. See Field Characters.

Plate 91, fig. 8

LOCAL NAME. *Sarrek-chak-pho* (Lepcha).

SIZE. Sparrow; length c. 15 cm (6 in.).

FIELD CHARACTERS. Male (adult), summer. General effect pied black and white. *Above*, dark ashy grey with black streaks; a white supercilium; sides of head black. Tail black with whitish outer edges. A concealed white shoulder-patch visible in flight. *Below*, throat white, breast and flanks pale grey, belly whitish.

In winter feathers of crown, back, breast and flanks tipped with rufous brown.

Female. *Above*, rufous brown faintly streaked with darker brown; a pale supercilium; sides of head dark brown; upper tail-coverts rusty; tail dark brown, outer rectrices rusty. *Below*, chin and throat white, rest of underparts fulvous, darkest on breast.

STATUS, DISTRIBUTION and HABITAT. Common resident, subject to altitudinal and short-range seasonal movements. The lower Himalayas from N.W.F.P. to Arunachal Pradesh, thence south through Nagaland (?), Manipur, Meghalaya and Mizoram. Breeds between 1500 and 3300 m, optimum zone 1800-3000 m. Winters from c. 2400 (mostly below 1200 m) down to the foothills and into the Gangetic plain south to the Yamuna river, and throughout Assam and Bangladesh. Affects open, scrub-covered hillsides particularly along fringes of forest, glades, and in the neighbourhood of terraced cultivation; in central Nepal noted in barberry and juniper scrub on dry hillsides. Tolerates denser vegetation than other bush chats.

THRUSHES AND CHATS

39

rarely 6, pale blue marked with reddish freckles, mainly at the large end. Average size of 100 eggs 17.9 × 14.2 mm (Baker). Incubation by female alone. Often brood-parasitized by *Cuculus canorus*.

MUSEUM DIAGNOSIS. See Field Characters. Postnuptial moult complete in August and September. Nuptial plumage acquired by wear of brown tips of winter plumage. Young spotted. Postjuvinal moult of body-feathers and all coverts except primary- and outer greater coverts. First-year birds recognized by retention of juvenal primary- and outer greater coverts; male also by rusty tips of tail. For details of plumage see Baker, loc. cit.

MEASUREMENTS

TURDINAE

In winter frequents cultivated country, tea-gardens and grassland, especially *ekra* grass along rivers.

Saxicola ferrea

■ Breeding □ Winter

Extralimital. Ranges east through southern China south to the northern Indochinese countries.

MIGRATION. Occurs on summer grounds from March to September or October and in winter quarters from November to March.

GENERAL HABITS. Very parochial, frequenting the same spot day after day. Keeps singly or in pairs, sometimes in loose parties in winter. Usually perches on bush-tops or telegraph wires where available in typical bush chat fashion, flitting its tail. Drops to the ground for insects from time to time; frequently takes them also on the wing like a flycatcher.

FOOD. Insects and some seeds.

VOICE and CALLS. Call-note *prrei* (rising); alarm-notes *zee-chunk* repeated at short intervals, and a sharp *tak-tak-tak*; also a *tic-tic-brzezzee* (Fleming). Song typically chat-like: a short, pleasant but rather feeble trill *tiriririri* or *siriri-swirri*, the final *swirri* a rolling whistle, with some variations (SA). Generally uttered from a tree-top or other perch, or in the air during display flight. Song period, early April till end of June with a resumption from early September to end of October (Proud).

BREEDING. *Season*, February to May in Meghalaya, early April to July in the Himalayas. *Nest*, a cup of fine grass lined with finer grass-stems, rootlets, hair and sometimes a few feathers; usually placed in a little depression on sloping ground, well concealed by grass, sometimes under a stone or clod, rarely in holes in rock-clefts or stone revetments of hill roads. *Eggs*, 4 or 5,

1706. Isabelline Chat. *Oenanthe isabellina* (Temminck)

Saxicola isabellina Temminck, 1829, Pl. Col. (79), pl. 472, fig. 1 (Nubia, Africa)
Baker, FBI No. 512, Vol. 2: 49
Plate 91, fig. 10

LOCAL NAMES. *Gidik* (Brahui, all wheatears); *Pilo piddo* (Gujarat).

SIZE. Sparrow +; length c. 16 cm (6½ in.).

FIELD CHARACTERS. *Above*, sandy brown with a pale supercilium and eye-ring. Wings dark brown with buff edges. Upper tail-coverts and base of tail white; rest of tail blackish brown with narrow buff tips. *Below*, pale creamy buff, darker on breast and flanks. Sexes alike.

Half of tail, × c. 1

Distinguished from female *O. deserti* (1710) by its plumper build, heavier head, longer legs and absence of black in upper wing-coverts. In flight the white subterminal band on tail is noticeably broader, and more glistening white or buffy white in *deserti*.

STATUS, DISTRIBUTION and HABITAT. Mostly a winter visitor, fairly common. Breeds in northern Baluchistan (Chagai, Quetta) and in N.W.F.P. (Thall, Parachinar). Winters in all parts of Pakistan and the plains of northwestern India including N. Gujarat (with Kutch and Kathiawar).

THRUSHES AND CHATS

41

straggling east and southeast to Varanasi and Schore, and south to Ahmednagar (Fairbank, Blanford) and Poona, c. 18°30'N. (Abdulai & Pimento, JBNHS 65: 489). A passage migrant in Gilgit and other parts of Pakistan and northern India. Recorded in the Maldive Islands in November

Oenanthe isabellina

▨ Breeding ▤ Winter

(Phillips, JBNHS 60: 58). Affects sandy semi-desert and waste land with sparse *Capparis*, *Suaeda* and suchlike bushes, and old plough land. Prefers more sandy plains and not so much stony desert as *O. deserti*. Although found up to 3000 m (Afghanistan) it requires large, flat and desolate areas (Paludan).

Extralimital. Breeds west to Turkey, north and east to Lake Baikal, Manchuria and Kansu. Winters also in Baluchistan and west through Arabia and northeastern Africa south to Tanzania.

MIGRATION. Occurs on breeding territory from March to October. Arrives in winter quarters about the end of September (first date 4 August in Jhang District — HW), leaves in March (last date 29 April). Passage recorded in Gilgit in March and April.

GENERAL HABITS. Solitary, or in widely separated pairs. Very territorial, actively resenting intrusion by other chats into its 'sphere of influence'. Runs about swiftly, feeding on the ground, bobbing and curtsying from time to time. Sits very upright on a clod or mound, infrequently on low bushes; however, in midday heat in scrubless country often noted perching on telegraph wires in the shade of the insulators, in some areas nearly every pole having its chat!

Display. 'With drooping wings and outspread tail, male approaches female, uttering the whole while a pleasant whistle. When within a foot or

43

JBNHS 33: 604). [Alleged breeding near Thall (JBNHS 12: 339) proved to be of *Erythropygia* (loc. cit. p. 579).] Winters over most of Pakistan from N.W.F.P. and the northern foothills, south to Sind, Rajasthan (Mt Abu) and northern Gujarat. In Makran, from near sea level up to 3300 m. Recorded in autumn passage in Sairee 1500 m, Dharmsala 1350 m, and

Oenanthe xanthopyrmyna

Distributional ranges

▨ Breeding

▤ Winter

1 *kingi* (1707) 2 *chrysopygia* (RE) 3 *xanthopyrmyna* (RE)

Ranital 540 m. In winter affects semi-desert, flat, stony and sandy land with sparse *Capparis* and other xerophytic bushes, and sand dunes on the edge of desert; has a marked preference for the foot of rocky hillsides. In summer frequents arid rocky slopes especially in the vicinity of small, perennial streams, usually above 2100 m.

Extralimital. Breeds in Afghanistan and north to the Pamirs. The species ranges west to Iraq and Armenia.

MIGRATION. Occurs on winter grounds from the beginning of October till the end of March; in Kohat from September to mid April. Passage mostly in October and March, but movements also noted in December and February.

GENERAL HABITS. Usually seen singly, perching upright on clods or rocks, less frequently on low bushes, or running swiftly on the ground. Sometimes rapidly takes cover in gerbille holes and disappears down the subterranean tunnels. In winter almost everywhere in direct food competition with the more domineering *O. pinnata* by which it is mercilessly chivvied and chased.

FOOD. Ants and other insects.

42

TURDINAE

so of her rises about 18 inches off the ground and flutters in a rapid, oscillating motion . . . After this performance, alights near her and struts round with outspread wings and tail, singing all the time. He then shoots up into the air, hovers and performs aerial stunts, and descends to earth in a spiral motion' (C. H. Williams, JBNHS 33: 603). Display flight also described as follows: 'Soars into the air to a height of fifteen metres or so, hovers with beating wings and outspread tail, then sails gently downwards' (Ludlow). See also Meinertzhagen, 1934, *Birds of Arabia*, p. 245.

FOOD. Beetles and other insects; also some seeds.

VOICE AND CALLS. Little recorded. Song said to be very imitative (Dementiev) and louder than that of most chats. A low, sweet song may sometimes be heard in winter.

BREEDING. *Season*, March to June. Double-brooded. *Nest*, a shallow saucer made of grass stems, rootlets and wool, lined with hair and wool; placed in a hole, usually a rat's hole, sometimes a discarded bee-eater's burrow, about 50 cm or more from the entrance. *Eggs*, 4 to 6, generally 5, pale blue, occasionally with a few reddish brown spots at the larger end. Average size of 14 eggs from Baluchistan 21.9 × 16.7 mm (Williams); of 60 eggs 23.7 × 17.4 mm (Baker). Incubation apparently by female alone. Feeding of young by both parents.

MUSEUM DIAGNOSIS. See Key to the Species. Spring moult complete. Body moult noted in September and January (HW). Young has pale spots above, and dusky edges to breast-feathers. Postjuvenile moult complete.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail

Saxicola kingi Hume, 1871, Ibis: 29 (Jodhpur)

Baker, FBI No. 515, Vol. 2: 53

Plate 91, fig. 11

LOCAL NAMES None recorded.

SIZE. Sparrow +; length c. 16 cm (6½ in.).

FIELD CHARACTERS. Male (adult). *Above*, head and back pale grey-brown. A dull, greyish white supercilium. Rump rufous-ochre, upper tail-coverts and base of tail paler. Centre of tail and broad terminal band blackish brown. *Below*, whitish tinged with pink. Sexes alike.

The only chat or wheatear with rufous rump and base of tail, which together with greyish underparts make it distinctive in flight.

STATUS, DISTRIBUTION AND HABITAT. Mostly a winter visitor, locally common. Breeds in northern Afghanistan (Amran Khwajah and along Barshor hills — Christison, JBNHS 43: 479) and north of Quetta (Williams,

44

TURDINAE

VOICE AND CALLS. Alarm: a characteristic *thrrrr thrrr thrrr*, less harsh than of other wheatears (Lindon Cornwallis — for subspecies *chrysopygia*). Song said to be very imitative: a very loud warbling.

BREEDING. *Season*, April to June. *Nest*, placed in small hollows quite low down in a rock-face above water; or inside holes under stones or in walls — maybe up to 60 cm deep — generally on the steep sides of bare, rocky gorges. The shallow saucer of grass, lined with fine rootlets and grass fibres, rests on a foundation of flat pebbles — often a considerable quantity — and is protected by a rampart of same. *Eggs*, 4 or 5, pale blue with or without a few rusty spots. Average size of 22 eggs 20.7 × 16 mm (Christison, Williams). Other details of breeding biology not recorded.

MUSEUM DIAGNOSIS. See Field Characters. Young. Upperparts and sides of head a little browner than in the adult, no pale centres or dark edges. All wing-coverts with fulvous tips. Chin and throat grey, rest of underparts with a fulvous wash. Under tail-coverts paler fulvous than in adult.

MEASUREMENTS

1708. **Wheatear.** *Oenanthe oenanthe oenanthe* (Linnaeus)

Motacilla Oenanthe Linnaeus, 1758, Syst. Nat., ed. 10, 1: 126 (Sweden)

Baker, FBI No. 511, Vol. 2: 48

Plate 91, fig. 9

LOCAL NAMES. None recorded.

SIZE. Sparrow; length c. 15 cm (6 in.).

FIELD CHARACTERS. Male (adult), winter. *Above*, crown and back brownish grey. Lores to ear-coverts black. A white supercilium and white rump. Wings black. Centre of tail and terminal band black; base and sides white. *Below*, throat and breast pale to deep buff; rest of underparts cream-buff.

In summer crown and back become more pure grey, forehead white. First-winter male like female.

Female, winter. *Above*, crown and back rufous brown. A light supercilium. Ear-coverts brown. Rump white; tail as in male. *Below*, as in male.

In summer crown and back become greyer brown.

STATUS, DISTRIBUTION AND HABITAT. A straggling passage migrant through Pakistan and the northwestern Himalayas, which apparently lie on the extreme eastern fringe of its normal migration route; recorded in Chagai, Baluchistan (March and October, *Ibis* 1941: 541), Chitral (April, at c. 1200 m), Gilgit (March at c. 1500 m), and Wardwan Valley, Kashmir (September, JBNHS 18: 462); a vagrant also recorded once near Mhow in Madhya Pradesh (Jerdon). On migration affects open stony country and cultivation.

Extralimital. Breeds in Europe and the Middle Eastern countries, east through Afghanistan and central Asia to eastern Siberia and western Alaska. Winters in Africa south of the Sahara. Another subspecies in Greenland and Labrador.

MIGRATION. Spring migration takes place mostly in April, autumn migration in September and October.

GENERAL HABITS. Generally seen singly or in twos and threes during migration. Moves on ground in a quick succession of long hops, frequently halting on some little eminence such as clods or rocks; occasionally perches on bushes or low trees. Sometimes makes little dashes into the air for insects. Carriage upright, but seldom remains still, constantly bowing and bobbing, at same time spreading tail and moving it up and down.

FOOD. Mostly insects, sometimes seeds or berries.

VOICE AND CALLS. Alarm-note *chack-chack* or *weet-chack-chack*. Usually does not sing when migrating.

BREEDING. Extralimital. A single record from Chitral c. 1300 m (Perreau, JBNHS 19: 908).

MUSEUM DIAGNOSIS. See Field Characters and Key to the Species. For details of plumages and structure (also bionomics) see Withersby, 1938, 2: 145-9.

MEASUREMENTS

♂♀	18-20	27-29 mm (HW)

Weight 8 ♂♂ 21-29; 1 ♀ 22.6 g (Dementiev).

COLOURS OF BARE PARTS. Iris brown. Bill black. Legs and feet dark brown to black; claws black.

OENANTHE DESERTI (Temminck)

Key to the Subspecies

White on inner web of second primary reaching quill.....	<i>O. d. oreophila</i>
White on inner web of second primary not reaching quill....	<i>O. d. deserti</i>

1709. **Tibetan Desert Wheatear.** *Oenanthe deserti oreophila* (Oberholser)

Saxicola oreophila Oberholser, 1900, Proc. U.S. Nat. Mus. 22: 221 (Ladak), new name for *Saxicola montana* Gould, 1865 (Tibet), *nee Saxicola montana* Koch, 1816 Baker, FBI No. 514, Vol. 2: 52

LOCAL NAMES. None recorded.

SIZE. Sparrow; length c. 15 cm (6 in.).

Extralimital. Breeds in southern Tibet from the Pamirs to the headwaters of the Yangtze. Winters in southern Iran, Arabia and eastern Africa (Ripley & Bond, 1966, *Smithsonian Misc. Coll.* 151: 29).

MIGRATION. Arrives on breeding grounds about the middle of April, remains till September. Passage takes place in March-April and September-October.

GENERAL HABITS AND FOOD. As in 1710.

VOICE AND CALLS. Alarm-note *chuck-chrr*. Song, a mournful yet melodious, three- or four-syllable *tee-ti-ti-ti* repeated monotonously by male all day long in the vicinity of the nest; occasionally given during short hovering flight of five seconds or so a few metres above nest site (SA).

BREEDING. Season, May to July. Nest, a cup of moss, grass and goat hair neatly lined with wool, hair and sometimes feathers; placed on the ground in deep hollows under boulders or in cairns of *mani* stones, chortens, etc. Eggs, normally 4 or 5, pale blue or bluish green with small reddish specks at the broad end. Average size of 11 eggs 22.3 × 16.6 mm (BB), of 8 eggs 21.4 × 15.5 mm (HW). Both parents tend the young. Share of the sexes in other chores, and incubation period, not recorded.

When nest approached (3 separate observations at different nests) the female, uttering alarm-note and flicking tail excitedly up and down, repeatedly attacked and drove off her fussing mate from the vicinity as if afraid of his betraying position of nest (SA).

MUSEUM DIAGNOSIS. See Field Characters. Differs from *deserti* (1710) in having a longer wing and the inner web of the second primary white to the quill. Birds from Afghanistan are intermediate (Paludan).

Juvenile. Upperparts greyish brown with darker edges; pale brown on mantle. Underparts dirty white with faint brownish edges to breast-feathers. Lesser and median wing-coverts brown with pale centres and tips; inner greater coverts like the rest, not white (HW).

Postjuvenile moult of body-feathers, lesser, median, and at least inner half of greater coverts. Postnuptial moult chiefly in August.

MEASUREMENTS

Saxicola atrogularis Blyth, 1847, Jour. Asiat. Soc. Bengal 16: 131 (Agra)
Baker, FBI No. 513, Vol. 2: 51

Plate 91, fig. 12

LOCAL NAME. *Rāna piddo* (Gujarat).

FIELD CHARACTERS. Male (adult), summer. Above, crown and back an dy buff; a pale supercilium. Upper tail-coverts and basal half of tail creamy white; rest of tail black. Wings blackish brown. Inner webs of remiges partly white, this character more pronounced in flight than in 1710. *Below*, throat and sides of head black; rest of underparts buffish white.

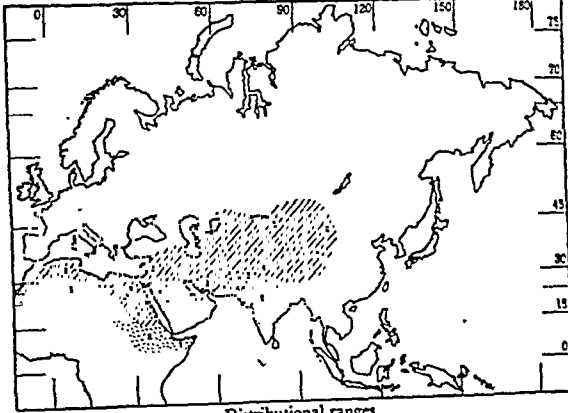

Half of tail, x c. 1

In winter the black parts are fringed with whitish.

Female. Above, like male but greyer; wings and tail a lighter brown. Ear-coverts rufous-brown. *Below*, whitish buff, breast darker.

STATUS, DISTRIBUTION AND HABITAT. Summer visitor, locally abundant. Breeds in Kashmir, Balistan, Ladakh, Lahul and Spiti, between c. 3000 and 5100 m, optimum zone 3600-4600 m. Winters in Baluchistan and possibly in Sikkim and Assam (Margherita, North Cachar — Baker, loc.

Oenanthe deserti

▨ Breeding

▤ Winter

1 *oreophila* (1709) 2 *deserti* (1710) 3 *homechroa* (RE)

cit.). An April record from Garhwal at c. 1800 m (A. E. Osmaston). On breeding grounds affects bleak rocky or sandy plateaux and hummocks covered with sparse furze (*Coragana*) bushes; usually avoids steep slopes.

SIZE. Sparrow; length c. 15 cm (6 in.).

FIELD CHARACTERS. As in 1709, q.v. See Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Mostly winter visitor. Pakistan (fairly common) and India east to Bihar and south to central Maharashtra (Poona, Ahmednagar) and northern Andhra Pradesh (Nirmal). A few pairs breed in the Quetta area of N. Baluchistan (Marshall *apud* Baker, *Identification* 2: 44). Affects arid semi-desert broken tracts, either sandy or rocky, sometimes with sand dunes and scanty scrub; also freshly ploughed and fallow land in canal-irrigated colonies in desert.

Extralimital. Breeds in central Asia north of the range of *oreophila* and west to the eastern Mediterranean. The species ranges in North Africa to Morocco.

MIGRATION. Occurs in winter quarters from mid September to April in the northwest and chiefly from November to February over the rest of its Indian range.

GENERAL HABITS. Those of the genus. Often found in same terrain as other desert-loving chats and Short-toed larks. Usually perches on a small eminence or low bush whence it darts down to take its prey or flies up flycatcher-style for insects. Display flight as of *Or. isabellina*, (1706) q.v.

FOOD. Insects, chiefly beetles.

VOICE AND CALLS. Song variable and imitative; may occasionally be heard during winter months. Alarm-note *chi-ti-ti* (SA).

BREEDING. Season, April to June. Nest, a cup of grass, hair and wool lined with similar but softer material, placed in holes in bank or among stones. Eggs, 4 to 6 (Dementiev), very pale blue with a few faint markings at the large end. Average size of 30 eggs 19.7 × 15.4 mm (Baker).

MUSEUM DIAGNOSIS. Differs from *oreophila*, q.v., in being smaller and having less white in wing (white area on inner web of second primary does not reach quill).

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail

Plate 91, fig. 15

LOCAL NAMES. None recorded.

SIZE. Sparrow +; length c. 17 cm (6½ in.).

THRUSHES AND CHATS

49

FIELD CHARACTERS. Male (adult), summer. *Above*, crown and back dirty (buffish) white; rump and base of tail pure white. Central rectrices (except base) and terminal band of tail black, with a narrow white fringe to the lateral feathers. Wings black. *Below*, throat and sides of head black; rest of underparts buffish white.

Half of tail, $\times c. 1$

In winter, upperparts heavily fringed with grey buff, except white upper tail-coverts; black of throat barred with narrow rufous fringes; flight-feathers edged with pale rufous.

Female. *Above*, sandy brown, rump and upper tail-coverts white. Tail as in male. Wings dark brown with pale fringes. *Below*, sandy white, throat sometimes blackish.

Could be mistaken for female *deserti* (1710) but upperparts more greyish brown; throat and sides of

neck greyish brown (v. whitish buff); less buff on breast; tail white with only central rectrices and terminal band black (v. almost wholly black).

STATUS, DISTRIBUTION and HABITAT. Mostly winter visitor in northern Baluchistan where fairly common. Breeds in the Quetta Valley at about 1800 m (Williams, JBNHS 33: 603) and in the hills northeast of Nushki and north of Quetta (Christison, JBNHS 43: 479). Affects dry, stony foothills and desolate narrow valleys; in winter also found in arid semi-desert plains.

Extralimital. Extends north to Kirghiziya and west to northeastern Iran. Winters in southern Iran and southern Afghanistan. The nominate race breeds in Turkey and Israel. May be a race of *O. lugens* widespread in Africa (cf. Dementiev).

MIGRATION. Winter visitors arrive mostly in October.

GENERAL HABITS. Those of the genus. Very shy.

BREEDING. *Season*, April to June. *Nest*, a flat saucer of grass and sticks lined with finer grass and hair, placed in a hole in a bank or rock face, or under a heap of stones. *Eggs*, generally 5, deeper blue than 'other chats' eggs, with a zone of rusty spots at the large end and a few odd spots elsewhere. Average size of 14 eggs 19.3×15.4 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters and Key to the Species.

Juvenile with stub tail, ready to leave nest. Pale earthy isabelline below and slightly darker above, with very broad margins to primaries and secondaries. Even paler than juvenile *isabellina* (1706) and lacks the spotting of the latter (Meinertzhagen).

MEASUREMENTS

	Wing	Tarsus	Tail

THRUSHES AND CHATS

51

STATUS, DISTRIBUTION and HABITAT. Partly resident, chiefly winter visitor. Breeds commonly in northern Baluchistan [Kalat, Fort Sandeman, Sulaiman Range — SF 3: 206; JBNHS 31: 707 and 59: 962 (*picata*)], Quetta [JBNHS 14: 480 and 16: 750; *Ibis* 1920: 164 (*picata*)], Fort Munro [JBNHS 37: 689 (*picata*), and markedly less *opistholeuca*], Peshawar [JBNHS 32: 748 (*capistrata*)], Kohat and Kurram Valley [JBNHS 12: 339, 18: 192 and 20: 778; *Ibis* 1909: 217 (*capistrata* and *picata*)], Chitral [JBNHS 16: 50 (*capistrata* and *opistholeuca*)], Baltistan and Gilgit [*Ibis* 1881: 56, 441; *Ibis* 1927: 582; JBNHS 42: 659; SF 10: 112, 226 (*capistrata* and *picata* with every possible intergradation)]. Affects boulder-strewn barren country,

Oenanthe picata

Breeding

Winter

steep river banks, fallow fields, tumbledown buildings and precincts of villages, from c. 600 m (Peshawar) to 3300 m (Quetta, Chitral), optimum zone 1800-2400 m. Common and generally distributed in winter in Pakistan and northwestern India southeast to Delhi, central Madhya Pradesh and northern Maharashtra (Khandesh). In winter frequents stony semi-desert, and desert with sparsely scrubbed sand dunes, cultivation, ravines, outskirts of villages and nomadic encampments, cattle corrals, etc.; usually from almost sea level to c. 1200 m, but has been observed also at 2700 m in deep snow!

Extralimital. Ranges north to Turkmenia and west to northern Iran.

MIGRATION. Arrives on breeding grounds in March (Baluchistan) or mid April (Chitral), remains till September. May be seen in winter quarters from the beginning of August till the end of March.

Plate 91, fig. 17

LOCAL NAMES. *Monu* (Baluchi); *Kābāro piddo* (Gujarat).

SIZE. Sparrow +; length c. 17 cm (6½ in.).

FIELD CHARACTERS. A black-and-white polymorphic chat; intermediates occur especially in females (cf. Paludan, 1959, pp. 205-13).

*capistrata* phase ♂, $\times c. 1$

of tail which are white; central rectrices and terminal band of tail black.

Female has black parts replaced by sooty black.

2. White-bellied phase ('*picata*'). [The most common within our limits.] Male (adult). Like the preceding but belly white. Female similar to male but black parts replaced by greyish brown; belly more buffish.

3. White-crowned phase ('*capistrata*'). Male (adult). Like *picata*, with white belly and black throat, but crown and nape white. Female similar to male but black parts and crown earthy brown; belly more buffish.

N.B. The geographical dominance of the three types of females does not exactly correspond to the dominances of the three colour phases of the males (Paludan, p. 208).

Half of tail, $\times c. 1$

TURDINAE

52

GENERAL HABITS. Usually met with singly, perched on some prominent position such as walls, bushes or corner of a roof, bobbing and curtsying vehemently from time to time, especially when alarmed; darts down to the ground to seize insects and then moves off to another vantage point. Also makes aerial sorties after winged insects like a flycatcher. In the heat of the day sits quietly in some shady spot, often on doors and windows of occupied houses. Frequently roosts in a hole under the roof of a bungalow. Very territorial even in winter and resents intrusion of the same or other species with similar feeding habits; its persecution of the Indian Robin (1720) and Redtailed Chat (1707), in particular, markedly noticeable everywhere.

FOOD. Chiefly insects — ants, beetles, caterpillars, etc. Also berries of 'pipal' [*fic*] and *Grewia* (Waite).

VOICE and CALLS. Has a pretty song, something like the Magpie-Robin's. Is also a good mimic, taking off to perfection, among others, the Common Babbler, Indian Wren-Warbler, Tailor Bird, Redwattled Lapwing and Spotted Owlet; also the twittering song of the Swallow and the musical soliloquy of the Rufousbacked Shrike (SA). Sings from a perch or on the wing, making short flights from a projecting rock, flying with hovering wings, tail spread and a little drooped. Song, or snatches of it, may also be heard on its arrival in winter quarters, especially while chasing off food competitors. Other notes unrecorded.

BREEDING. *Season*, March to August. Double-brooded (Whitehead). *Nest*, a shallow saucer of grass, feathers, wool and bits of rag, lined with hair and wool; placed in holes in rocks, banks, walls, cairns or under stones, sometimes under the eaves of houses or among rafters, occasionally in a tree-hollow. Once placed on a foundation of flat stone chips (Waite, JBNHS 37: 689), cf. 1707. *Eggs*, 4 to 6, pale blue marked with reddish brown at the large end. Average size of 50 eggs 20.7×16 mm (Williams), of 92 eggs 20.5×15.4 mm (Baker). Young fed by both parents.

MUSEUM DIAGNOSIS. See Field Characters. For distinguishing male of phase 2 from *O. alboniger* see under 1714.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail

Baker, FBI No. 504, Vol. 2: 40

Plate 91, fig. 16

LOCAL NAME: *Monu* (Baluchi).

SIZE. Sparrow +; length c. 17 cm (6½ in.).

THRUSHES AND CHATS

53

FIELD CHARACTERS. Male (adult). *Above*, forehead, crown, rump, basal third of tail and outer rectrices white, the latter more or less marked with brown towards the tip. Middle of back and central rectrices black. *Below*, sides of head, throat and breast black, rest of underparts white.

Half of tail, x c. 1

Female. *Above*, sandy brown. Rump and upper tail-coverts creamy fawn. Tail as in male but white replaced by buff. *Below*, pale dingy buff.

Distinguished from *O. picata* and *O. pleschanka* by almost entirely white outer rectrices.

STATUS, DISTRIBUTION and HABITAT. Probably resident, very local and little known. Recorded only in the winter months from the Makran coast [Gwadar, Samán, Dasht (Baluchistan), Sehwan and Kirthar hills (Sind)].

All records are nineteenth-century, from Hume and Blanford. A bird of the most desolate desert ravines.

Extralimital. Extends west to the Dead Sea and the Red Sea coast of Egypt.

GENERAL HABITS, FOOD and VOICE. Practically unknown.

BREEDING. Unknown.

MUSEUM DIAGNOSIS. See Key to the Species.

MEASUREMENTS			
	Wing	Bill (from feathers)	Tarsus
♂ ♀	101-106	16-17	c. 24
			67-70 mm (Baker)

Weight 1 ♀ (winter) 22.5 g — Cornwallis.
COLOURS OF BARE PARTS. Iris brown. Bill, legs and feet black.

1714. **Hume's Chat.** *Oenanthe alboniger* (Hume)

Saxicola Alboniger Hume, 1872, *Stray Feathers* 1: 2
(Stony hills which divide Kelat from Sindh... and Mekran Coast)
Baker, FBI No. 505, Vol. 2: 40

Plate 91, fig. 14

LOCAL NAME. *Monu* (Baluchi).
SIZE. Sparrow +; length c. 17 cm (6½ in.).
FIELD CHARACTERS. *Above*, rump and base of tail white. Outer rectrices white with a broad black terminal band; central rectrices black. Head and rest of upperparts black. *Below*, throat black, rest white. Sexes alike.
Almost identical with male *O. picata* (white-bellied phase, q.v.). Doubtfully distinguishable from it in the field by plumage though black of throat

THRUSHES AND CHATS

55

found in Sind (*Birds of Arabia*, p. 254). Nest placed in holes in rocks, sometimes quite high in the face of cliffs; in Iran also recorded in walls and deserted mud buildings. Eggs, 4 or 5, very pale skim-milk blue, some spotless others with a few speckles of pale reddish. Average size of 20 eggs 22.5 x 16.8 mm (Baker).

MUSEUM DIAGNOSIS. Very similar to male *O. picata* phase 2, but black more intense and glossier. Black on underparts restricted to throat: 25-36 mm (from point of chin) v. 35-38 mm in *picata*. White on rump more extensive: 31-50 mm (from black of back to black of central rectrices) v. 16-23 mm in *picata*. Feet larger and stronger (Lindon Cornwallis pers. comm.).

Postnuptial moult complete, June to August. Young similar to adult but black replaced by glossless black-brown, no spotting (Meinertzhagen).

MEASUREMENTS			
	Wing	Bill (from skull)	Tail

COLOURS OF BARE PARTS. Iris brown. Bill, legs and feet black.

1715. **Pleschanka's Chat.** *Oenanthe pleschanka pleschanka* (Lepechin)
Motacilla pleschanka Lepechin, 1770, *Novi Comm. Acad. Petrop.* 14: 503, pl. 14, fig. 2 (Saratov, lower Volga)
Motacilla leucomela Pallas, 1771, *Novi Comm. Acad. Petrop.* 14: 584, pl. 22, fig. 3 (Samara, Russia)
Baker, FBI No. 509, Vol. 2: 45
Plate 91, fig. 13

LOCAL NAME. *Monu* (Baluchi).
SIZE. Sparrow; length c. 15 cm (6 in.).
FIELD CHARACTERS. Male (adult), summer. *Above*, crown and nape white, more or less sullied by brown tips of feathers. Neck (all round), back and wings black. Rump and base of tail white. Central rectrices blackish; outer rectrices white with blackish terminal band, this colour extending on extreme outer web to about half the length of tail. *Below*, chin and throat black; rest of underparts white.

x c. 1

In winter the black of mantle and throat is fringed with pale brown. Underparts, from throat downwards, dirty white ('rufous-fawn').

Female. *Above*, brown. A buff supercilium. Wings dark brown edged with buff. Rump white. Tail pattern as in male. *Below*, throat and breast pale brown, rest of underparts buff.

54

TURDINAE

does not extend as far down on breast. Is also somewhat larger and noticeably 'bull-headed', with usually a more upright stance when perched. Call-notes may differ but comparable details not available. The only pied chat with sexes alike — a useful clue to its identification when birds are paired.

STATUS, DISTRIBUTION and HABITAT. Fairly common resident, subject to some vertical movements. Sind in the higher Kirthar hills, Baluchistan from the Makran coast to Fort Sandeman, Balistan, Astor and Gilgit to

Oenanthe alboniger

Distributional range

Wanla Nala, a side nullah in the Suru Valley (BBO, JBNHS 34: 121). Breeds around 1500-1600 m. Affects steep boulder-strewn sides of nullahs.

Extralimital. Extends to Afghanistan, southern Iran, Muscat and Oman.

GENERAL HABITS. Little recorded. Field notes vitiated by likelihood of confusion with *O. picata*. Described as less shy and more 'stolid' (HW). Usually seen perching on large rocks, telegraph wires, etc. whence it darts to the ground for food.

FOOD. Insects.
VOICE and CALLS. Said to have a loud, melodious song, although not a very varied one. Call-note, a short, sharp, high-pitched whistle uttered three or four times. Alarm, a harsh grating note (Currie).

BREEDING. Season, April to June. *Nest*, a saucer of twigs plastered with mud into which chips of limestone are incorporated; poorly lined with soft grass, hair and feathers. 'In front of the nest was a barricade of stones, highest next the nest and then shelving off towards the entrance of the hole. This particular barricade weighed two pounds [= 910 g]' (Currie *apud* Baker). No such rampart was noticed by Meinertzhagen near two nests

TURDINAE

56

A rare colour phase ('*vittata*') occurs in which both male and female have a white throat.

STATUS, DISTRIBUTION and HABITAT. Common summer (breeding) visitor. N.W.F.P. in Kohat, Kurram Valley and Chitral, and the northwestern Himalayas from Gilgit through Ladakh to Lahul and probably Spiti. Breeds between 1500 and 3100 m [record of nests taken at 4500 m in Ladakh (Ludlow, JBNHS 27: 142) is believed to be erroneous and should be cancelled according to communication by the author to HW]. Affects stony wasteland. Often found in same biotope as *O. picata*.

Extralimital. Ranges east to Lake Baikal and Manchuria, west to Iran and the Black Sea. Replaced in the Mediterranean countries by the very similar *O. hispanica*. Winters in southern Iran, Arabia and Africa.

MIGRATION. A straggler or rare migrant in Kashmir and Punjab (April). Regular on passage in northern Baluchistan in March-April and September-October. An October record in the Indian Ocean halfway between Ceylon and the Somali coast, due south of the Makran. A straggler to the Maldive Islands (November and December — Phillips, JBNHS 60: 581), Sri Lanka (November — Henry, *Birds of Ceylon*, p. 25) and possibly Kanyakumari (Cape Comorin) (JBNHS 62: 558).

GENERAL HABITS. Those of the genus. Perches upright; wags tail up and down. Often flies a few metres straight up into the air in pursuit of winged insects.

Display. Male flies in circles at a considerable height, singing the while, sometimes ending the display by making a remarkable dive to earth at lightning speed.

FOOD. Chiefly insects, also berries.
VOICE and CALLS. A clear song, very variable and imitative, delivered from a rock or during courtship flight (described above).

BREEDING. Season, May to July. *Nest*, a cup of dry grass or weed stems well lined with rootlets and hair, placed in holes under stones or rocks. Eggs, 4 to 6, pale blue spotted with reddish at the large end. Average size of 40 eggs 19.6 x 15.1 mm (Baker). Young fed by both parents.

MUSEUM DIAGNOSIS. See Field Characters and Key to the Species.
Young. Head, back, median and lesser coverts pale brown with pale centres and dark edges. Rump and upper tail-coverts white. Underparts creamy white with faint dark edges. Young *picata* (1712) is much darker above and *deserti* (1710) much paler. Postjuvinal moult of body-feathers, median and lesser coverts, and most or all greater coverts.

Genus CHAIMARRORNIS Hodgson

Chaimarrornis Hodgson, 1844, in Gray's Zool. Misc.: 28.Type, by monotypy, *Phoenicurus leucocephala* VigorsCf. Deshayes, M., 1969, *Ibis* 111: 244-6 for affinities with African *Thammodia*.

Tail rounded. Wing long but with large first primary equal to half the length of second. Tarsus long and strong. Sexes alike. Young lightly mottled.

1716. Whitecapped Redstart or River Chat. *Chaimarrornis leucocephala* (Vigors)*Phoenicurus leucocephala* Vigors, 1831, Proc. Zool. Soc. London: 35

(Himalaya = Simla-Almora area)

Baker, FBI No. 534, Vol. 2: 79

Plate 89, fig. 19

LOCAL NAMES. *Chets tal*, Kumidi (Kashmir); *Gir-chaondia* (Hindi); *Kali-pholia* (Mohun Ghat, U.P.); *Mali-lap-pho* (Lepcha); *Chubia rati* (Bhutan).

SIZE. Bulbul; length c. 19 cm (7½ in.).

FIELD CHARACTERS. Above, crown and nape white. Forehead, sides of crown, sides of head, back and wings black. Rump and tail rich chestnut, the latter rounded and with black terminal band. Below, throat and breast black. Rest of underparts rich chestnut. Sexes alike.

x c. 1

The similarly patterned *Phoenicurus erythrogaster* (1678) has a white wing-patch.

STATUS, DISTRIBUTION AND HABITAT. Common altitudinal migrant in the Himalayas from N.W.F.P. and Hunza east through Arunachal Pradesh. Thence south through Nagaland at least to the hills of Cachar and Manipur (Hume, no date given). Breeding zone: N.W.F.P. 1800 to 3600 m; Baltistan and Ladakh 2500-3300 m; Kashmir 2100-3600 m, on Pir Panjal above 2700 m; Duala Dhar 2400-3600 m; Lahul, Spiti and Garhwal 2400 to 3900 m; Nepal 1800-5300 m; Sikkim up to 5100 m; Bhutan 1800-4500 m. Overall optimum zone 2400-3300 m. Winters (September to April) mostly below 1500 m, sparsely up to 2100 m (Kashmir) or 2600 m (Nepal, Sikkim), down to the foothills; occasionally into the adjacent plains up to 10 km or so. Recorded in winter in northern Baluchistan (Quetta, Beeli, Manji) and in the Khasi Hills. Affects rocky or stony edges of large swift-running, often partially frozen, streams, usually avoiding smaller rivulets frequented by the Plumbeous Redstart. In forested areas remains close to water, but in open country such as the alpine zone, often found considerable distances away. In winter often along the edge of canals at low elevations, even sections running through towns (Dehra Dun, Roorkee).

EXTRALIMITAL. Ranges west to northeastern Afghanistan, Tadzhikistan and Pamirs, east in the mountains of eastern Tibet, western, northern and central China.

GENERAL HABITS. Keeps singly or in pairs, perching on boulders amidst torrents or rocky banks or sometimes on roofs of houses in the immediate vicinity of water. Captures insects borne along on the swirling current or

58

TURDINAE

Chaimarrornis leucocephala

Breeding

Winter

sallies into the air with quick twists and turns after winged quarry. Also flies out erratically over the torrent and zigzags in aerial pursuit of midges, returning to its base on outstretched, rapidly vibrating wings. When perched, and also upon alighting after a sortie, wags expanded tail jerkily and deliberately up and down two or three times from a cocked position until it almost presses on the perch, with wings drooping on either side. A deep bow or curtsy frequently accompanies this action. A pair's territory may extend to a 600-metre stretch of stream. Intrusion of this by forktails and other food competitors is vehemently resisted.

Display. Extraordinary behaviour described by M. J. Hackney (JBNHS 50: 655) as follows: '... this pool (about 5 feet in diameter) contained a slow circular eddy and was almost completely surrounded by small boulders. Its verge was occupied by four to five redstarts, all of them facing inwards and intent on the antics of two others which were floating in the pool. These two were leaning back on spread tails in the water, their heads held high and drawn back, their open wings thrust outwards and downwards into the water to maintain balance. In this position they sailed round and round the pool, facing one another across it; when the current drew them towards the pool centre, they fluttered together and collided breast to breast once or twice after which they drew apart again and repeated the whole performance ... Later I noted that one of the swimmers was apparently worsted and retired to a ring-side seat on the rocks, his place in the arena being immediately taken by a new entrant; and that at one period there were as many as three birds in the pool at the same time.' All birds were in adult plumage; the scene took place in early May.

THRUSHES AND CHATS

59

FOOD. Chiefly insects; also berries (Alexander, JBNHS 48: 106; also GD). VOICE AND CALLS. Alarm-note, a loud, shrill *tee* audible a long way off and above the roar of rushing water. Call-note, a short *sit sit*. Song, a long, melodious and somewhat melancholy whistle (Schäfer), apparently infrequently uttered.

BREEDING. Season, May to August, chiefly June and July. Double-brooded (Magrath, JBNHS 19: 149), at least in the lower zone. Nest, a deep, massive cup of moss, leaves, roots and grass, thickly lined with wool and hair; usually well concealed in holes in steep banks, under a boulder or a cavity in the face of rock close to water; also occasionally in road cuttings, holes in trees or old stumps, or under the eaves of streamside houses. Eggs, normally 3 or 4, sometimes 5, pale blue-green, profusely marked with dark reddish brown spots usually more numerous at the larger end where they occasionally form caps or rings. (For variants see Baker, *Nidification* 2: 75.) Average size of 50 eggs 24.6 × 16.8 mm (Baker). Building of nest and care of young by both sexes; incubation by female alone, period undetermined.

MUSEUM DIAGNOSIS. See Field Characters. Postnatal moult complete, in August and September. A spring moult of body-feathers and rectrices about March. Young not spotted in the manner of redstarts, but rather similar to that of some wheatears: mantle blackish brown, a few feathers fringed with fulvous. Crown white, the feathers fringed with blackish. Rump and tail as in adult. Underparts blackish, the feathers edged with rufous, more densely so on belly. Under tail-coverts chestnut.

THRUSHES AND CHATS

61

c. 1000 m, locally 1500 m. Affects open scrub jungle in arid and stony country, desert with scattered Euphorbias and camel-thorn bushes, tamarisk scrub and the edge of cultivation or near habitations, sometimes in damp *kandi* jungle.

GENERAL HABITS. Keeps singly or in pairs, hopping or running along the ground with quick mincing steps, now mounting a bush or termite mound, now descending to pick up some crawling insect. In the neighbourhood of villages tame and confiding, often perching on roofs or entering verandas in search of food within arm's length of the inmates. Tail carried erect and flipped up and down, sometimes tossed so far forward as almost to touch the head, especially in moments of excitement. A nearly full-fledged young has been noted to feign death when touched, 'in a very convincing manner, closing its eyes, extending its neck and maintaining its limpness when handled' (SA). For display see 1720, under General Habits.

FOOD. Chiefly insects and their larvae: grasshoppers, ants and other Hymenoptera. Partial to termites and is commonly in attendance on or near ant-hills.

VOICE AND CALLS. As in 1720.

BREEDING. Season, March to August. Nest and eggs as in 1720. Clutch size normally 4, often 3, occasionally 2. Average size of 100 eggs 21.1 × 14.9 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters.

Young. Not spotted. Similar to female but darker brown; throat lightly mottled.

63

SIZE. Sparrow; length c. 16 cm (6½ in.).

FIELD CHARACTERS. A sprightly glistening black robin with a conspicuous white patch on wings and chestnut under base of the jauntily cocked tail. Like 1717 (q.v.) but upperparts entirely blue-black v. dark brown. Female as in 1717.

STATUS, DISTRIBUTION AND HABITAT. Very common resident except on the humid west coast where less generally distributed. Southern India south of the Krishna river; plains and hills up to c. 900 m, locally up to 1800 m. Affects thin scrub jungle, dry deciduous forest, dry stony ground with short grass and a sprinkling of young date or *Borassus* palms; sparse bushes and ant-hills, fallow paddyfields bordered by *Lantana* thickets, and gardens in village precincts.

GENERAL HABITS. As in 1717.

Display. 'The male ran swiftly in front of the female, moving in a large semicircle and in short dashes of a few yards. As he ran he opened and drooped his wings slightly so that their tips trailed along the ground, flaunting thus the white shoulder-patches. The tail was very slightly spread and also trailed along the ground the chestnut at its base thus being completely concealed. At the same time the breast was puffed out, the neck stretched upwards, and the head and bill pointed into the air; once or twice during a short run they were lowered horizontally to the ground. After completing several runs in this manner, the male turned toward the female and ran up to within a few feet of her. As he approached, he took on a new and completely different form; by the time he stopped in front of her the tail had been raised up over the back, bringing into view the chestnut crissum, the feathers of which were puffed out to more than their normal prominence. The wings were kept very slightly open, keeping the shoulder-patch in view; the head and neck were drawn into their normal shape. He kept himself sideways on to the female, fluffed out his whole body and tilted slightly towards her, quivering excitedly all the while. He kept this position for a few seconds, then, slowly resuming his normal shape, hopped towards the female; pairing followed immediately. After the act he began to display once again in a manner and sequence identical with his first performance. The division of the display into two quite definite phases, wherein at first the male dances, with no attempt to show off his colours, but then relies entirely on its colour pattern and not on his dance is most striking' (C. R. Stonor, *Ibis* 1944: 91). In aggressive display male postures and struts against another trespassing on his territory — stretching his neck and bill nearly vertical, puffing out his belly-feathers, erecting and cocking forward his fanned tail till it almost touches the crown, and flicking it provocatively while the chestnut under tail-coverts are fluffed and sticking out in prominence. At the same time he half droops his wings flaunting the white patches in obvious defiance of the intruder. He flies from one perch to another in his territory with slow deliberate 'delayed action' wing-beats (SA).

FOOD. As in 1717.

VOICE AND CALLS. A short cheery warble of four to eight notes composed of shrill whistles gliding into each other; thinner and less varied than that

62

TURDINAE

MUSEUM DIAGNOSIS. Differs from *cambaiensis* in being a darker brown above and having slightly shorter wings and tail.

MEASUREMENTS

Wing 2 ♂♂ 71, 73; 2 ♀♀ 69, 70 mm (Koelz)

COLOURS OF BARE PARTS. As in 1717.

1719. Deccan Black Robin. *Saxicoloides fulicata intermedia* Whistler & Kinnear

Saxicoloides fulicata intermedia Whistler & Kinnear, 1932, Jour. Bombay nat. Hist. Soc. 36: 73 (Raburi, Ahmednagar)

Baker, FBI No. 557 (part), Vol. 2: 111

LOCAL NAMES. Kāichuri (Hindi); Kāidunnat, Chirak (Marathi); Nalanchi (Telugu); W'annati kūrūri (Tamil).

SIZE. Sparrow; length c. 16 cm (6½ in.).

FIELD CHARACTERS. As in 1717.

STATUS, DISTRIBUTION AND HABITAT. Very common resident. Central India from the Tapi river, southern Madhya Pradesh and Orissa south to the Krishna river; plains and hills up to c. 900 m. Affects gardens, groves village precincts, boulder and cactus country, cultivation and open scrub jungle, and stony deciduous forest.

GENERAL HABITS AND FOOD. As in 1717 and 1720.

VOICE AND CALLS. As in 1720.

BREEDING. As in 1720.

MUSEUM DIAGNOSIS. Differs from *cambaiensis* (1717) in having the black of back and crown heavily washed with a darker, chocolate-brown. Female similar to that of *fulicata* (1720).

MEASUREMENTS

TURDINAE

64

of the Magpie-Robin (Nichols). A secondary song heard in October is reminiscent of a Magpie-Robin's sub-song. Song uttered from the ground or a low perch with tail cocked high and wings partly drooping at the sides while the bird turns excitedly this way and that. A short monosyllabic whistle *uueech* or *sueet* repeated by male every second or two when agitated, as when nest approached by an observer; a harsh *chur-r, chur-r* of concern by both sexes when nest being handled.

BREEDING. Season, end of February to July; in humid Kerala December to April. Rears up to three broods. Nest, a shallow cup of grass, rootlets and rubbish, lined with hair, fibres and wool; in certain areas, bits of snake slough almost invariably used for nest lining. One nest examined was made entirely of human hair. Nest usually placed in holes in walls, earth banks or trees, under boulders or in rock crevices, occasionally inside buildings in a variety of situations like shelves etc., or sometimes in a derelict tin can or earthen water-pot. Once found in a thorn bush about 60 cm from the ground. Eggs, usually 3, sometimes 2, pale greenish, greyish or yellowish white, with specks or small reddish brown blotches and underlying marks of lavender, usually more numerous at the larger end. Laid in early morning at c. 24-hour intervals. Average size of 100 eggs 20.8 × 14.8 mm (Baker). Building of nest by both sexes. However, George (1963: 73) reports that in one case the male did not participate in building the second nest, having the complete charge of the first brood fledglings. Site of first nest generally used for subsequent broods, only a new lining being added. Same site often used year after year if undisturbed. Incubation chiefly by female. During very hot days (c. 40°C), a female was observed brooding only at night, leaving the nest unattended by day. Incubation starts with second egg; period, 11 or 12 days. Feeding of young and nest sanitation by both parents. Male excessively wary and elusive in approaching nest when both parents. Male suspicious of being observed. Brooding of young by female alone. Male brings food to brooding female who in turn feeds nestlings. For further details on breeding behaviour see J. C. George, 1963, *Paco* 1: 71-8.

MUSEUM DIAGNOSIS. Male has entire upperparts glossy blue-black, similar to that of *leucoptera* (1721); chestnut on vent more extensive. Female less dark, more greyish. In both sexes bill is less heavy than in Sri Lanka birds. Postnuptial moult complete, in August-September. When hatched, naked chick covered with blackish brown skin, later with black down.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	70-80	14-16	24-27	60-67 mm
♀♀	69-75	13-16	23-25	58-66 mm
				(HW, SA)

Weight 1 ♂ 20 g (SA).

COLOURS OF BARE PARTS. Adult. Iris brown. Bill, legs and claws brownish black. Mouth blackish brown, slaty pink or greyish pink (varying with age?). Juvenile. Iris olive-brown. Mouth bright yellow. Legs and feet greyish black; claws black.

THRUSHES AND CHATS

65

1721. Ceylon Black Robin. *Saxicoloides fulicata leucoptera* (Lesson)*Microtus leucopterus* Lesson, 1840, Rev. Zool.: 136

(Indes Orientales = Ceylon)

Baker, FBI No. 556 (part), Vol. 2: 109

LOCAL NAMES. *Kalu-polkichcha* (Sinhala); *Kari-kuruzi*, *Kaddukari-kuruzi* (Tamil).
 SIZE. Sparrow; length c. 16 cm (6½ in.).

FIELD CHARACTERS. As in 1717, but upperparts entirely glossy blue-black as in 1720. See Museum Diagnosis.

STATUS, DISTRIBUTION and HABITAT. Very common resident. Sri Lanka in all zones; up to c. 1500 m on the drier northeastern side, lower elevations in more humid districts. Affects scrub-land and gardens.

GENERAL HABITS and FOOD. As in 1717.

VOICE and CALLS. A merry *cheery-wee* and a harsh, scolding *chee*. Song as in 1720.

BREEDING. Season, in the hills from the end of March to June with a second period in August-September. Most pairs rear two broods during the first period and one in the second. In the low-country Wet zone from March to July with a peak in May. Nest, frequently built in cavities in the side of termite mounds. One was found in the old nest of a wren-warbler (*Prinia sylvatica*) in the crown of a low-growing date palm. Other usual sites as in 1720. Eggs, usually 2, sometimes 3, similar to those of *fulicata* (1720). For further details on breeding see Phillips, 1939, pp. 256-9.

MUSEUM DIAGNOSIS. Upperparts entirely glossy blue-black. Differs from *fulicata* (1720) in having a smaller amount of chestnut on vent, and a heavier and longer bill. Females are darker throughout. Complete postnuptial moult from August to December.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	73-79	15-17	25-27	61-69 mm
♀♀	70-74			57-62 mm
				(HW)

Weight 2 ♂♂ 17, 22 g (SDR).

COLOURS OF BARE PARTS. Iris brown. Bill black. Legs and feet brownish black.

Genus MONTICOLA Boie

THRUSHES AND CHATS

67

Winterquartiere der Steinmerle (*Monticola saxatilis* L.), Orn. Monatsb. 45(2): 33-41.

GENERAL HABITS. Keeps singly or in pairs according to season, rarely in loose parties during migration 'moving through the forest from tree-top to tree-top' (Titchhurst). Often perches on boulders, prominent rocks or tops of bare trees and bushes, descending to the ground and hopping about to forage for short periods.

Display. In song-flight male flutters up with spread tail and slow wing-strokes, and descends gently with extended wings to perch again.

FOOD. Chiefly insects; also berries (*Ibis* 1933: 463).

VOICE and CALLS. Very silent except near nest where alarm-notes may be heard, a repeated *whet* and occasional *tat-tak*. Song, a variable melodious warble, usually on a descending scale, uttered from a perch or in song-flight. Song period April to July, with occasional resumption in August (Desfayes).

BREEDING. Season, May and June. Single-brooded. Nest, a cup of grass stems and roots lined with rootlets, generally placed in rock crevices within three metres or so from the ground. Eggs, 4 or 5, deep turquoise. Average size of 92 eggs (from Europe) 25.9 × 19.5 mm (Witherby). Building of nest apparently by female alone. Incubation by female; period undetermined. Care of young by both sexes.

MUSEUM DIAGNOSIS. See Field Characters.

Young similar to female but paler, more mottled. Remiges with broad buff edgings. For details of plumages and structure (also bionomics) see Witherby, 1938, 2: 141-4.

MEASUREMENTS

Baker, FBI No. 612, Vol. 2: 177

Plate 92, fig. 7

LOCAL NAMES. None recorded.

SIZE. Bulbul; length c. 19 cm (7½ in.).

FIELD CHARACTERS. Male (adult), summer. Above, head, nape and upper back pale blue. Back and rump white, more or less sullied with grey-blue. Tail rufous, central rectrices brown. Below, throat pale blue; rest of underparts orange-rufous.

In winter, feathers of upperparts are fringed with buff, those of belly with whitish. Easily recognized by white back.

Female. Above, grey-brown with dark shaft-streaks, most feathers tipped with whitish buff. Below, centre of throat white, sides streaked with dark brown. Rest of underparts buff, heavily marked with dark brown on breast, less on flanks and belly.

Both sexes distinguished from other rock thrushes by rufous tail, particularly noticeable when spread in flight.

STATUS, DISTRIBUTION and HABITAT. Fairly common passage migrant in autumn in Ladakh, Baltistan, Gilgit, N.W.F.P., northern Punjab, Baluchistan and the hills of Sind. Also recorded in Liddar Valley and at Lahore. Observed mostly above 2100 m; as high as 5000 m in the Karakoram. Has straggled to Sikkim *vide* Vaurie (1959). Rare on spring passage: Karachi (once), Ladakh (once, at 4100 m), the hills of Sind and Baluchistan (perhaps regularly). Breeds (sporadically?) in N. Baluchistan, Quetta region at c. 2000-3000 m [JBNS 31: 711; also a juvenile obtained in June (Hume coll.)]. Affects rocky hillsides.

Extratropical. Breeds in southern Europe and across central Asia to Mongolia and northern China. Winters in Africa.

MIGRATION. Autumn passage takes place from the end of August through September and sparingly till the end of October; in Sind till November. Spring passage from March to early May, ♂♂ leading the vanguard.

The Rock Thrush furnishes a classical example of exceptional E.-W. migration, similar to that of *Falco vespertinus* (220). The entire palaearctic population, which extends from the Iberian peninsula to NE. China, winters in Africa south of the Sahara. For northeastern birds this means an E.-W. journey of at least 7500 km each way. Contra Baker, no part of the total population winters anywhere in tropical Asia. For a full account of migration see Hermann Grote, 1937, 'Die Brutgebiete, Zugwege und

68

TURDINAE

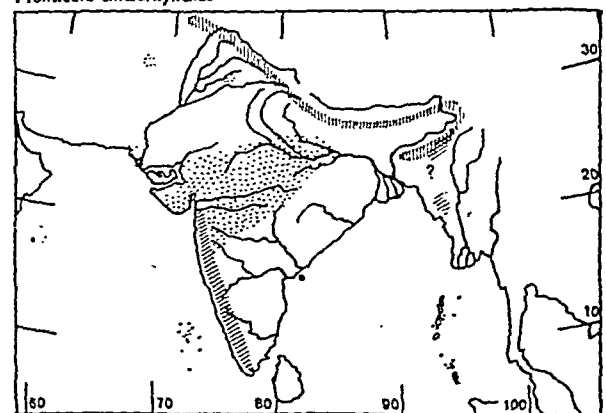

rufous; tail blackish narrowly edged with blue. Below, throat blue; rest of underparts orange-rufous.

In winter, black feathers of back edged with fulvous. White wing-patch identifies the male.

Female. Above, plain olive-brown. Below, squamated whitish and dark brown.

Distinguished from female *solitarius* (1725-6) by olive-brown upperparts and tail, and whitish under tail-coverts.

STATUS, DISTRIBUTION and HABITAT. Common summer (breeding) visitor: the Himalayas from N.W.F.P. and Kashmir east through Arunachal Pradesh thence south through Nagaland, Cachar, Khasi and Garo hills. Also breeds in Gilgit (Biddulph, *Ibis* 1880: 271 and SF 10: 262). Optimum breeding zone 1200-2200 m; occasionally down to 1000 m (Sikkim, Bhutan) or as high as 3000 m (Kashmir, Sikkim). A juvenile obtained at 3600 m in

Monticola cinclorhynchus

Distributional range

- Breeding
 Main winter
 Known but scarce winter occurrence

the Liddar Valley in August (LaPersonne coll.). Winters mostly in the Western Ghats from about the Tapi river (Dangs dist., Gujarat) south through Maharashtra, Karnataka, Kerala and western Tamil Nadu; also recorded in the cold weather in Madhya Pradesh (D'Abreu, JBNS 38: 97, Hewetson, *ibid.* 53: 608) and at Lucknow (U.P. — Reid, SF 10: 37) and Mt Abu (Rajasthan — Butler, SF 3: 470); also observed, early February, in Sialkot dist. and near Karachi (T. J. Roberts, pers. comm.); said to be a rare cold-weather visitor in Kohat (Whitehead, *Ibis* 1909: 223). Common

THRUSHES AND CHATS

69

in winter in North Cachar (Baker, JBNHS 9: 138) and probably other parts of Assam. Recorded in Sikkim in November and March. Winters occasionally in the plains but mostly in the foothills and up to the highest summits, frequenting moist-deciduous and secondary evergreen jungle, coffee and cardamon plantations in the hills, mango groves in the plains. In summer affects open forest, especially pine (*Pinus longifolia*), and rocky grass-covered slopes.

Extralimital. Breeds in adjacent parts of northeastern Afghanistan. Winters also in Arakan (Burma). *M. gularis*, often considered a subspecies, breeds in southeastern Siberia and northern China, and winters in southeastern Asia; nearest record, Mt Victoria (Heinrich).

MIGRATION. Begins to arrive on summer grounds about mid April, occasionally end of March, remains till September. Autumn migration in September-October recorded over most of the Peninsula west to Karachi. In winter quarters from mid October to end of March. Spring passage, chiefly in April.

GENERAL HABITS. A forest bird; usually quite secretive. Keeps singly or in pairs; in winter sometimes among the itinerant mixed flocks. Largely arboreal, finding most of its food in trees, in the form of insects picked off the trunks and branches (Betts), but also descends to the ground momentarily for some titbit or to rummage amongst the mulch like its congeners. When disturbed flies up silently into overhanging branches; perches bolt upright and wags tail slowly and deliberately up and down.

Display. 'Floats down from the top of a tree to a lower one with wings outstretched and singing all the time like a skylark' (Magrath).

FOOD. Chiefly insects; also other small animals such as frogs and lizards. Occasionally seeds and berries, and flower-nectar (*Erythrina*, *Salmalia*).

VOICE AND CALLS. A peculiar grating call-note, seldom uttered (Betts). Another call rendered as *peri-peri* (Fleming) and an alarm-note given as *goink-goink* (Magrath). Song, reminiscent of that of *Saxicola torquata*, but richer; has a recognizable thrush-like quality, though the notes are not very clear-cut: *tra-tree-treea-tra-prua-triri-prua-tri* (Lister); also rendered as *teu-li-di*, *teu-li-di*, *teu-li-di*, *teu* repeated with varying emphasis, but rather monotonously (Magrath). Delivered from the topmost branch of a fir or pine, or during the volplaning song-flight—commonly in the mornings and evenings. Song period mid March to mid June (Proud).

BREEDING. Season, May (exceptionally April) to July. Nest, a cup of grass, twigs, roots, pine needles and some moss, lined with fine rootlets; placed on sloping ground, under a rock, a tuft of grass or among the roots of a tree, or in rock crevices; once found in the top of a pollarded tree about three metres above the ground. Eggs, normally 4, sometimes 3, rarely 5, pale yellowish cream to deep buff densely freckled with reddish. Average size of 3 eggs 23.7 × 17.9 mm (BBO). Building of nest, incubation and care of young by both sexes. The bird is a very close sitter, but when disturbed leaves with swift, direct flight, usually straight downhill and without uttering a sound.

MUSEUM DIAGNOSIS. See Field Characters.

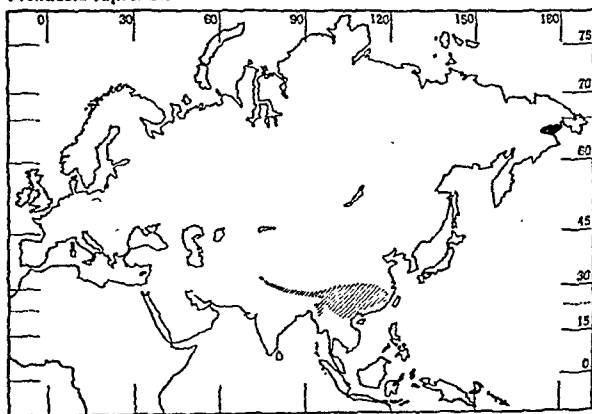

Young male. Above, head and back entirely spotted (buff with dark brown margins). Wing-coverts and tertials edged with buff. Upper tail-coverts rufous.

THRUSHES AND CHATS

71

with scattered trees; presence of rocks or cliffs appears to be essential to its requirements. In eastern Himalayas avoids deciduous forest.

Monticola rufiventris

■ Distributional range

Extralimital. Extends east through southern China to Fukien.

GENERAL HABITS. Keeps singly or in pairs; perches upright on bushes, trees and rocks swaying its tail slowly up and down. Feeds mostly on the ground; also hawks winged insects by aerial sorties in the manner of drongos. Often perches facing along the big branches rather than crosswise, and carries its tail high and cocked (SDR). Birds have been observed roosting in the gable of a bungalow roof and in a hole in the chimney.

FOOD. Beetles, tipulids, grasshoppers (GD), butterflies, moths and other insects. Also berries and seeds (the latter probably from berries).

VOICE AND CALLS. Alarm-note, a jay-like, harsh rasping indrawn rattle *chkhrrr* interspersed occasionally with a high shrill tick (SDR). Also a curious *quach*—apparently a contact note (Proud). Has a pleasant warbling song somewhat resembling that of *cinclorhynchus* (1723), rendered as *tetateutele-tetate* *teu* repeated several times with variations (Magrath); almost invariably uttered from the top of a tall tree. Song period, from the beginning of April till at least mid July (Proud).

BREEDING. Season, April to July, single-brooded. Nest, a cup of dry grass and pine needles or other material on a foundation of twigs, lined with rootlets and fine grass; usually placed in crevices or holes in the face of cliffs or on ledges, sometimes in hollows in banks or among the roots of trees. Eggs, 3 or 4, pale cream suffused with pink and finely but profusely freckled all over with light red-brown, usually forming a zone at the large end. Average size of 75 eggs 26.8 × 19.9 mm (Baker). Building of nest by both

70

TURDINAE

Tail slightly tipped with rufous. *Bleue*, like female but pale buff, not whitish. Under tail-coverts buff, not whitish marked with brown.

Young female similar but lacks rufous upper tail-coverts.

Postjuvénal moult of body-feathers in July–September. Postnuptial moult complete about August–September. No spring moult but wearing off of fringes makes summer plumage darker.

MEASUREMENTS

Weight 2 ♂♂ (summer) 32, 35.6; 1 ♀ (May) 38 g (GD). 2 ♂♂ (March, April) 39.5, 32.5 g (BB). 15 ♂♀ (early May, prior to northward migration from Peninsula) 30–41 (av. 36.2) g—SA.

COLOURS OF BARE PARTS. Iris brown. Bill blackish (♂), dark brown (♀), paler at chin; gape and mouth yellow. Legs and feet greyish brown.

1724. Chestnutbellied Rock Thrush. *Monticola ruficentris* (Jardine & Selby)

Turdus erythrogaster Vigors, 1832, Proc. Zool. Soc. London: 171 (Himalayan mountains), nec *Turdus erythrogaster* Boddaert, 1783

Petrocincla ruficentris Jardine & Selby, 1833, Ill. Orn. 3, pl. 129, restricted to Simla by Ripley, 1961, Synopsis: 523)

Baker, FBI No. 605, Vol. 2: 170

Plate 92, fig. 1

LOCAL NAMES. Ningri-pho (Lepcha); Daohangar (Cachari).

SIZE. Myna ±; length c. 24 cm (9½ in.).

FIELD CHARACTERS. Male (adult). Above, brilliant cobalt-blue with some blackish on mantle. Lores, ear-coverts and sides of neck black. Below, throat blackish blue; rest of underparts chestnut.

Female. Above, back and rump olive-brown with dark crescent-shaped bars. Conspicuous buff eye-ring and buff patch on sides of neck. Ear-coverts dark grey-brown more or less mottled with buff. Below, centre of throat whitish or buff, sides of head dark grey mottled with buff; rest of underparts squamated dark brown and buff.

Distinguished from female *solitarius* (1725–6) by whitish throat-patch.

STATUS, DISTRIBUTION AND HABITAT. Resident, subject to vertical movements, fairly common: from the Murree hills and possibly Swat, Kohistan (sight record, 18 July, T. J. Roberts, pers. comm.) eastward along the Himalayas through Arunachal Pradesh (Ludlow, 1944) thence south through Nagaland, Manipur and Mizoram. Breeds between 1200 and 3300 m (a sight record at 3500 m in central Nepal—MD), optimum zone 1800–2400 m. Winters (October to March) from c. 1800 m down to the foothills and occasionally into the plains (Ambala); in Nepal and Garhwal up to 2300 m, in Bangladesh in the hill tracts of the Chittagong region. Affects open forest of pine, oak, fir and deodar on steep hillsides, and rocky slopes

72

TURDINAE

sexes. Incubation by female only (Jones, JBNHS 47: 239); period undetermined.

MUSEUM DIAGNOSIS. See Field Characters.

Young, both above and below with ochraceous spots and dark brown fringes. Postjuvénal moult of body-feathers, lesser, median, and inner half of greater coverts. First-year birds recognizable by ochraceous tips to primary-coverts and unmoulted greater coverts.

FIELD CHARACTERS. As in 1726, q.v.

STATUS, DISTRIBUTION AND HABITAT. Winter visitor (October–mid April) to Pakistan from Kohat to northern Baluchistan where it appears to replace the breeding population in that season. Winter range extends to Sind and probably central and coastal Makran down to sea level. Breeds in northern Baluchistan between 2100 and 3000 m and N.W.F.P. north to Samana and Kurram Valley, above 1500 m in the latter localities, and occasionally in the Murree hills (T. J. Roberts, pers. comm.). Movements of local breeders not known. Intergrades with *pandoo* (1726) in the Safed Koh and eastern Afghanistan (Meinertzhagen, *Ibis* 1938: 682, Vaurie, 1965, and Paludan, 1959). Affects rocky and boulder-strewn country, generally in the vicinity of streams.

Extralimital. Extends west to northern Iraq and the Caspian Sea. The nominate race ranges through the Mediterranean countries to Spain and Morocco; *pandoo* occurs in the Himalayas, and *philippensis* eastward to Japan and Taiwan.

THRUSHES AND CHATS

73

Monticola solitarius

1 *longirostris* (1725) 2 *pandoo* (1726) 3 *philippensis* (RE)

GENERAL HABITS, FOOD AND VOICE. As in 1726.
BREEDING. As in 1726.

MUSEUM DIAGNOSIS. Differs from *pandoo* in being paler and slightly smaller.

MEASUREMENTS

Wing ♂♂ 116-127 mm; ♀♀ 113-125 mm (CBT, HW, Paludan)
Weight 6 ♂♂ (April-August) 43-53; 2 ♀♀ (June-July) 51, 53 g (Paludan).
COLOURS OF BARE PARTS. As in 1726.

1726. Indian Blue Rock Thrush. *Monticola solitarius pandoo* (Sykes)

Petrocincla Pandoo Sykes, 1832, Proc. Zool. Soc. London: 87 (Ghauts, Dukhun)

Petrocincla affinis Blyth, 1843, Jour. Asiat. Soc. Bengal 12: 177

(Tenasserim and Darjeeling)

Baker, FBI Nos. 608 and 609, Vol. 2: 175

Plate 92, fig. 4

LOCAL NAMES. *Pāla tiriv* (Kashmir); *Pāndu* (♂), *Maal* (♀) (Marathi); *Podakachi pitta* (Telugu); *Pārakkili* (Malayalam); *Ningri-pho* (Lepcha); *Deohangar* (Cachari); *Hengmfrunsi* (Kacha Naga); *Vohitigle* (Mikir).

SIZE. Bulbul +; length c. 23 cm (9 in.).

FIELD CHARACTERS. Male. Whole plumage dark leaden blue, very bright, almost azure blue in summer. Wings and tail brown. In winter, feathers are fringed with fulvous above, brown on breast and white on belly.

Female. Above, grey-brown with fine dark shaft-streaks; barred with blackish on rump. A pale wing-bar particularly conspicuous in flight.

THRUSHES AND CHATS

75

FOOD. Chiefly insects (grasshoppers, termites, dragonflies, etc.), spiders and centipedes, lizards and small frogs. Also banyan and peepul figs, *Lantana* and other berries, and small seeds.

VOICE AND CALLS. Very silent in winter. Song, a soft, melodious, rather short whistle, 'at times reminiscent of English Blackbird [*Turdus m. merula*]' (E. A. Osmonston), uttered from a commanding position or during volplaning song-flight. Song period starts in March in winter quarters. Female with food in bill awaiting her turn to feed the chicks, announces her arrival to male within the nest-hole by a short impatient *peep* (like a redstart's) uttered repeatedly (SA). No other notes recorded.

BREEDING. Season, April to July. Nest, a cup of grass and roots lined with hair and rootlets, well concealed in crevices of rocks or holes in walls. Eggs, 3 to 5, pale blue usually with a few rusty blotches scattered over the surface. Average size of 14 eggs 26.7 × 19.7 mm (BBO), of 32 eggs 26 × 19.1 mm (Baker). Incubation apparently by female alone; period undetermined. Care of young by both sexes.

MUSEUM DIAGNOSIS. Differs from *longirostris* in being darker and slightly larger on average. Winter specimens from Assam, Meghalaya, etc.; often show a variable amount of rufous on vent, being intermediates between *pandoo* and east Asian *philippensis*.

Young male, sooty brown washed with bluish grey, feathers of crown, sides of face, chin, throat and upper breast with subterminal pale fulvous spots; rest of plumage faintly fringed with fulvous. Wings and tail as in adult male but greater coverts and tail with broader pale edges.

Young female, similar but paler and browner; wings and tail as in adult female. Postjuvinal moult about August-September, does not include primaries, primary-coverts, secondaries or the tail. These are not moulted till the second autumn. Adults undergo a complete moult about August to October. There is no spring moult. Both male and female show a certain amount of variation in the amount of spotting and barring of the body plumage (HW). Postnuptial moult complete about August to October. No spring moult.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	111-136	25-29	25-32	77-95 mm
♀♀	112-121	25-29	25-30	75-88 mm
			(HW, SA, Roonwal)	

Weight 5 ♂♂ 44-52; 1 ♀ 45 g (Roonwal, SA, BB).

COLOURS OF BARE PARTS. Iris brown. Bill dark brown; mouth pinkish flesh or lemon-yellow. Legs, feet and claws black.

Genus MYIOPHONUS Temminck¹

Myiophonus Temminck, 1822, Pl. col. 2(29), pl. 170. Type, by original designation, *Myiophonus metallicus* Temminck = *Turdus flavirostris* Horsfield

Arreaga Lesson, 1831, Traité d'Orn.: 388. Type, by monotypy,

Turdus cyaneus = *Sitta glauca* Temminck

Cf. Delicour, J., 1942, Act 59: 246-64.

¹ On spelling of *Myiophonus* v. *Myiophonus*, see Deignan, H. G., 1965, Bull. Brit. Orn. Cl. 85: 3; also Bowers, 1961, JBNHS 58: 670, note.

74

TURDINAE

Below, whitish, cross-barred brown. In silhouette, both at rest and in flight, confusable with Brown Rock Chat (1692).

Female distinguished from that of *rufiventris* (1724) by less boldly barred underparts and lack of distinct throat-patch. Female *cinclorhynchus* (1723) is olive-brown above, not grey-brown, and has whitish not fulvous vent.

STATUS, DISTRIBUTION AND HABITAT. Common summer (breeding) visitor to the Himalayas, from Chitral, Hunza and Ladakh east to central (Lowndes, 1955, JBNHS 53: 32) and eastern Nepal (Mt Everest region — Hingston, JBNHS 32: 322 and Kinnear, *Ibis* 1922: 507). One observation from Darjeeling 1350 m in June (Lister, JBNHS 52: 41). No other summer data from Sikkim, or from Bhutan and Arunachal Pradesh, although the species is common then in the dry valleys of southeastern Tibet (Schäfer). From Chitral to Garhwal, breeds between c. 1500 m [locally 1300 m (Chitral) or 1200 m (Kangra, Kulu), up to c. 3000 m (Chitral)] and 4000 m (Ladakh to Garhwal). In Nepal apparently breeds only at high elevations: Manangbhot 3600 m, Kharta 3700 m. An observation at 4800 m in July in the Rongshar Valley. The latter two localities are in Tibet (east of Mt Everest) but in Himalayan facies; the species is absent from the Tibetan plateau. Winters from the Himalayan foothills, including Sikkim, Bhutan and Arunachal Pradesh, south throughout India, Sind, Bangladesh and Assam; also Sri Lanka in the hills. Two records from Andaman Islands and one from Car Nicobar (accidental?). In the Himalayan foothills recorded in winter up to c. 1200 m (Kangra), 1400 m (Nepal), 1000 m (Sikkim) and 600 m in Bhutan and Arunachal Pradesh; in the hills of southern India up to c. 2100 m. Absent or very scarce in flat country (Gangetic plain, coastal Tamil Nadu and coastal Sri Lanka). In the breeding season affects barren rocky hills and precipitous hillsides. In winter frequents broken, rocky country, boulder hillocks, cliffs and rocks along sea shore, quarries, brick kilns, precincts of villages, old forts, buildings both ruined or inhabited, often in otherwise untypical country.

Extralimital. Turkestan and southeastern Tibet. Winters also in Burma. For range of the species see 1725.

MIGRATION. Occurs on summer grounds from April to September or October. Arrives in winter quarters in September in the north, October in the south.

GENERAL HABITS. Solitary in winter, pairs in summer. Very shy in summer but more confiding in winter when it often takes up its quarters among human habitations, resorting to the same spot year after year, and even roosting on the identical beam or cornice in a veranda or living room. Sits bolt upright on a prominent rock or roof-top bowing, curtsying and flirting tail vigorously every now and again. Feeds mostly on the ground but will occasionally take insects on the wing by vertical sorties into the air.

Display. In breeding season male indulges in short volplaning flights from one rock to another, showing off his brilliant blue plumage to best effect, and singing. In a pair with nest-young 'male repeatedly volplaned down to settle on a rock c. 15 m from the nest-hole. Each time upon alighting he raised his wings over the back and slowly and deliberately flapped them to the accompaniment of a subdued pleasant little song of 3 or 4 notes' (SA).

TURDINAE

76

Bill stout, shorter than head, laterally compressed and hooked at tip. Wing rather rounded. Legs long and strong.

Key to the Species

		Page

1727. Ceylon Whistling Thrush. *Myiophonus blighi* (Holdsworth)

Arreaga blighi Holdsworth, 1872, Proc. Zool. Soc. London: 444, pl. 19

(Banks of Lemastota-Oya, 4,200 ft, Haputale Dist., Uva, Ceylon)

Baker, FBI No. 616, Vol. 2: 182

Plate 90, fig. 12

LOCAL NAMES. None recorded.

SIZE. Myna; length c. 20 cm (8 in.).

FIELD CHARACTERS. Male. Whole plumage dark brown, head and neck nearly black; neck, breast, and back suffused with deep blue. A bright blue shoulder-patch.

Female. Whole plumage ferruginous brown, lighter below. A blue shoulder-patch as in male.

STATUS, DISTRIBUTION AND HABITAT. Species endemic to Sri Lanka. Resident in small numbers above c. 900 m, mostly between 1200

and 1800 m, in the hills of Central and Uva provinces. Affects damp, heavy forest, fern-clad ravines and gorges, especially those with a rapid torrent running through.

GENERAL HABITS. Keeps singly or in widely separated pairs, seldom far from a wooded stream. A lively and restless bird; runs rapidly and has a habit of frequently opening and shutting the tail. Quite crepuscular.

FOOD. Chiefly insects; also small frogs, geckos, etc. and possibly fruit.

VOICE AND CALLS. A shrill, sibilant whistle *streee . . .* often given by male in the evenings while flying to and fro above streams. Song [?], a 'long drawn plaintive though loud whistling note' (Legge).

BREEDING. Season, March to June ('January to May' — Henry). Nest, a large, neat and compact structure of green moss with some weed stems and decayed leaves, lined with blackish fern rootlets. Usually placed on a ledge of rock flanking a torrent or waterfall, about one to three metres from the ground; once among twigs of a bamboo stem in a jungle ravine. Eggs, 2 or often 1, whitish green with a few faint reddish brown streaks or speckles round the large end. Average size of 10 eggs 30.8 × 21.8 mm (Baker). Young fed by both parents. Share of duties unknown though incubation apparently by female only; period undetermined.

LOCAL NAMES. *Kāstūro*, *Indrārāj* (Gujarati); *Gogi* (Marathi); *Bhāngrāj* (Hindi, M.P.); *Gula-ukkee* (Kannada); *Singala karrai* (Telugu); *Chilakakka* (Malayalam); *Sikāram* (Tamil).

THRUSHES AND CHATS

79

2 or 3 (Kerala) often 4 (Maharashtra), pale clay colour sparsely covered with pale reddish specks, spots and small blotches. Average size of 46 eggs 33.1 × 23.9 mm (Baker). Building, incubation and care of young by both sexes. Incubation period 16 or 17 days.

MUSEUM DIAGNOSIS. See Field Characters.

Young. Whole upper- and underparts, lesser and median coverts dark sooty brown; wing and tail as in adult. Postjuvénal moult of body-feathers, lesser, median and innermost greater coverts and tertials. Postnuptial moult complete, September to November, beginning with remiges followed by rectrices, then body-feathers and lastly head; some body-feathers also fall during casting of remiges (McCann, JBNHS 35: 204).

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	152-165	32-34	39-49	107-121 mm
♀♀	143-151	30-32		94-108 mm

(HW, SA, Koelz)

Weight 10 ♂♀ 101-130 (av. 116.9) g — SA.

COLOURS OF BARE PARTS. Iris hazel brown or dirty olive-green (Roonwal). Bill, legs, feet and claws black. Mouth pale yellow or creamy pink (ad.), orange-yellow (pull.). Soles dirty white.

Miscellaneous. Nestlings are commonly taken from the nest to be raised as cage-birds for their beautiful song and imitative ability. Birds have been taught to whistle an entire tune. The growing demand from fanciers and the attractive prices the birds fetch have caused a noticeable decline in numbers in many of its best-known haunts.

SIZE. Pigeon; length c. 33 cm (13 in.).

FIELD CHARACTERS. A large Blackbird-like species entirely dark purple-blue spotted with glistening blue. Forehead, shoulders, edge of wing and

78

TURDINAE

SIZE. Myna; length c. 25 cm (10 in.).

FIELD CHARACTERS. Forehead bright cobalt blue; crown, neck, throat and upper breast dull black. Rest of plumage including wings and tail, glistening blue-black with bright cobalt blue shoulder-patch. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Resident, fairly common. Confined to perennial hill streams in the dry season but spreading into the foothills and adjacent plains during the rains. The hills of western Gujarat (Mt Abu, Himmatnagar), the Surat Dang, the Satpura Range (Melghat, Pachmarhi) east to Chota Nagpur (Surguja) and extreme northwestern Orissa (Bonai, Sundargarh district). The Western Ghats complex (including the Nilgiris and Palnis) from Khandesh south through western Karnataka and Kerala to the Ashambu Hills, east to the Shevaroy Hills in Tamil Nadu (JBNHS 36: 80). Affects swift-running rocky hill streams in shady evergreen jungle, dark cardamom ravines, etc. up to 2200 m; seldom found away from streams as the Himalayan species frequently is.

GENERAL HABITS. Keeps singly or in pairs. Feeds on the ground or in shallow water along the edge of streams, or hops from stone to stone snatching food as it is borne past on the current. Sometimes seen on forest paths or in gardens and compounds. Often perches on trees and readily takes shelter in caves and rocks. Every now and then the bird does a 'bend-stretch' on its legs and raises and lowers its tail, sometimes very slowly and deliberately; it is fully fanned out on the downward movement when its tip almost touches the ground.

FOOD. Chiefly insects, snails, worms, crabs, small frogs, etc; also drupes of *Jasminum* and wind-fallen figs and berries. Snails and crabs are purposefully battered on stones before being swallowed.

VOICE and CALLS. Alarm-note, a long-drawn piercing high-pitched *kree-ee* somewhat reminiscent of a Hill Myna, uttered chiefly while flying off from one section of a stream to another. Also some harsh notes. Song, a loud, rich whistle rambling aimlessly up and down the scale, so human in quality that it has earned the bird its popular name of Whistling or Idle Schoolboy. The melody is far superior to that of the Himalayan *M. caerules* (SA). Song period, February to September, but song sporadically heard also in December and January. It is one of the earliest bird calls in the morning.

BREEDING. Season, chiefly May to September (monsoon); in the south sometimes starting as early as March or even February. Double-brooded. Nest, a bulky cup of moss, roots and grass often secured in place and reinforced with mud, especially when built on a sloping ledge, lined with rootlets or moss. Usually placed on a ledge of rock beside a waterfall or torrent, often continually soaked with the spray. In the ghats a favourite site is on ledges of the dripping wet rock walls flanking entrances to the railroad tunnels, regardless of the many trains constantly thundering past; also within dank ill-lit tunnels that carry the water mains through the hills. Will occasionally nest in the rafters of a coffee estate building such as a mill or a pulphouse in the vicinity of water, or even in a hole in a tree up to c. 12 metres. A pair may occupy the same territory year after year, building in the same site, often on the foundations of an old nest. A second successive brood is frequently raised in the same nest without rebuilding (Betts). Eggs,

80

TURDINAE

tail brighter blue. A half-dozen white spots on median wing-coverts. Bill yellow. Sexes alike.

× c. 1

STATUS, DISTRIBUTION and HABITAT. Common resident, subject to vertical movements. The mountain ranges of Pakistan from northern Baluchistan to Chitral, Gilgit and Hunza, the Indus Valley as far as Upshi, and from Murree and Kashmir eastward along the Himalayas through Nepal, Sikkim, Bhutan and Arunachal Pradesh to the Dibang river (c. 95°-96°E. long., intergrading here with *eugeni*); also the Garo, Khasi and Mizo hills south

Myiophonus caeruleus

Distributional ranges

1 *temminckii* (RE) 2 *temminckii* (1729)
3 *eugeni* (1730) 4 Other subspecies

to the Chittagong Hill Tracts, Nagaland and Manipur. Breeds mostly between c. 1000 and 3500 m, but altitudinal distribution varies with local conditions: in Baluchistan above 2700 m, in the western Himalayas between

THRUSHES AND CHATS

81

1200 m (or possibly a little lower) and 3600 m, optimum zone 1500-2400 m. In Nepal occurs up to 4200 m (Lowndes, Diesselhorst), exceptionally higher (5180 m — Biswas, JBNHS 58: 670). Upper limit coincides with tree-line. Winters from c. 2400 m (in Sikkim 2700 m) down to the foothills, in Pakistan to the Salt Range and Lahore along the better wooded nullahs (T. J. Roberts, pers. comm.). Affects rivers and torrents especially in heavy forest, ravines and gorges, sometimes streams with sparse bush or tree growth, but not in bare country.

Extralimital. The species extends west to northern Afghanistan and Turkestan north to Ala Tau, east through the Indochinese countries, south through Malaya and Sumatra to Java, and north in China to Kansu and Hoph.

GENERAL HABITS. Keeps singly or in pairs. A conspicuous bird of torrential hill streams running through jungle and cliffs, every gorge seeming to hold a pair. In the western Himalayas also frequently seen around hill-station bungalows, and everywhere partial to hill roads. Unlike *M. horsfieldii* (1728) often wanders considerable distances away from water. Hops rapidly from rock to rock amidst a rushing torrent to seize morsels floating past, or on the forest floor and bridle paths, turning over and flicking aside the leaves in search of food. Often perches in trees. Has a habit of fanning its tail upon alighting, raising and lowering it very slowly and deliberately. It is fully expanded on the downward movement. Progresses on ground in long hops, or runs in spurts with quick mincing steps. Feeding behaviour and movements typically Blackbird-like. Markedly crepuscular, often feeding and on the move till well after dusk.

Aggressive Display (e.g. when mobbing owl). Spreads tail, droops wings throws out chest and struts stiffly in front of intruder, striking bellicose postures.

FOOD. Mainly earthworms, snails, crabs, larvae and aquatic insects, but will also take hatchling birds and almost any small living creature; also berries and some vegetable matter (horsedung, SA). Snail shells purposefully battered against stones to get at the contents.

VOICE AND CALLS. Call-note, an 'exceedingly strident tzeet tze-tze-tzeet' which carries far above the roar of the waters' (Bates). Alarm-note, a loud, shrill *kreee* given both in flight and when perched. Song, often uttered on the wing, a sweet, rather thin whistle which follows a definite pattern with slight variations (Lister); very human in quality but clearer and more resonant, though far inferior as a melody to that of its southern congener (1728). Main song period, end of February till end of June, with a resumption from mid August to end of September; may occasionally be heard as early as January (Proud). Sub-song (Sept.-Oct.): a subdued creaky jingle very reminiscent of song of Rosy Pastor (*Sturnus roseus*) but richer and more musical, lasting c. 3 minutes or more, practically without a break (SA).

BREEDING. Season, end of April to August. Double-brooded. [One pair laid again 11 days after first brood left nest (Jones, JBNHS 47: 240).] Nest, a bulky cup of green moss lined with rootlets, sometimes with a variable amount of mud admixed. Placed on a ledge or in a hollow or crevice of a boulder overhanging or amid a rushing stream, often wetted by the spray; occasionally on beams and rafters in forest bungalows, outhouses, etc., rarely

82

TURDINAE

even in a tree-hollow or on a horizontal branch. Eggs, 3 or 4, pale olive-grey to pale creamy buff with very faint reddish freckling, seldom distinctly marked. Average size of 10 eggs 36.9 × 25.6 mm (BBO), of 200 eggs 35.8 × 24.8 mm (Baker). Building of nest, incubation and care of young by both sexes. Brood-parasitizing by Hawk-Cuckoo (*Cuculus sparverivides*) recorded (Baker, JBNHS 17: 360, 362).

MUSEUM DIAGNOSIS. Differs from *eugeni* by the presence of white spots on tip of median coverts. Feathers of rump and, to a lesser extent, of belly largely white along the shafts but this colour always concealed. Postnuptial moult complete, July to October.

Young. Upperparts and wing-coverts dull brown tinged with purple. Wings and tail as in adult. Underparts dull brownish black, a faint purple tinge on breast.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	167-192	33-36	50-55	129-140 mm

LOCAL NAMES. *Daskat mibérang* (Cachari); *Kochikkili* (Malayalam).

SIZE. Myna ±; length c. 22 cm (9 in.).

FIELD CHARACTERS. Male. An unmistakable black-and-white thrush with a yellow bill. Above, black with a conspicuous white supercilium; wing and lower rump boldly spotted with white. Tail dark brown and white (central rectrices and outer webs of other rectrices dark brown, inner webs and tips white). Below, throat and breast black; rest of underparts white, flanks boldly barred with blackish.

Female. Above, olive-brown with a conspicuous buff supercilium. Wings spotted with buff. Tail olive-brown, tips of upper coverts white, outer rectrices partly white and with white tips. Below, throat buffish, sides mottled olive-brown and buff. Breast dark olive-brown with buff spots. Belly white, flanks and lower breast barred with brown.

The conspicuous supercilium, spotted wings and white in tail identify the female.

STATUS, DISTRIBUTION AND HABITAT. Uncommon summer (breeding) visitor to the Himalayas from Kulu Valley east through Mussooree hills, Simla, Garhwal, Nepal (Chitlang Valley — Biswas, JBNHS 58: 671;

84

TURDINAE

Dandeldhura, Trisuli and Kathmandu Valley — Fleming & Traylor, *Feldiana* 53: 182; Jaharpowah — Hodgson), Sikkim, Jalpaiguri duars and Bhutan foothills (on passage) and Arunachal Pradesh (Baker, *Nidification* 2: 127); also the Barail Range in North Cachar (Baker, loc. cit.). Breeds

Zoothera wardii

between 1500 and 2400 m, in Cachar down to 1200 m. Winters in Sri Lanka between c. 750 and 1500 m, where numbers fluctuate greatly from year to year. In summer affects well-wooded ravines and nullahs, edges of forest, small patches of forest and jungle in open country, even gardens (Naini Tal). In winter frequents forest, jungle in ravines, and well-wooded gardens.

MIGRATION. Arrives on breeding grounds in April, departs in September-October. Arrives in Sri Lanka in October-November, leaves in March. Passage noted in the Eastern Ghats and the hills of southern India, between 1000 and 2100 m, in October and in March-April (once in February). Point Calimere in Tamil Nadu (10°17'N., 79°52'E.) is one of the take-off points for Ceylon in autumn, but the bird evidently follows a different route on return passage in spring.

GENERAL HABITS. Keeps singly or in pairs according to season, sometimes in small flocks during migration. Feeds on the ground, hopping about among the mulch beneath undergrowth, turning over the dead leaves in search of food. Also ascends trees to feed on berries.

FOOD. Insects and berries.

VOICE AND CALLS. A strange, unmusical song of two notes (Brooks). A chirping call-note. Generally very silent.

THRUSHES AND CHATS

85

BREEDING. Season, May to July. Single-brooded. *Nest*, a deep, compact cup of green moss, grass and leaves with an inner layer of coarse roots cemented with a little mud, lined with rootlets and grass stems; placed in saplings between one and five metres above the ground, usually in a fork or on a horizontal branch near the trunk. *Eggs*, 3 or 4, white tinged with green, lightly speckled and blotched with pale reddish, sometimes over the whole surface, sometimes chiefly at the larger end. Average size of 30 eggs 26.3 × 19.4 mm (Baker). Building of nest, incubation and care of young by both sexes.

MUSEUM DIAGNOSIS. See Field Characters.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	110-119	25-28	26-28	{ 75-79 mm
♀♀	110-120			{ 74-82 mm
				(HW, MD, BB)

Weight 6 ♂♂ (October) 52-72 (av. 58.6) g—SA.

COLOURS OF BARE PARTS. Iris brown. Bill yellow (♂), brownish yellow (♀). Legs and feet pale brownish yellow.

1732. **Whitebrowed Ground Thrush.** *Zoothera sibirica sibirica* (Pallas)

Turdus sibiricus Pallas, 1776, Reise Russ. Reichs 3: 694
(Sibiriac = Dauria vide Hartert, i.e. SE. Transbaikalia)

Baker, FBI No. 585, Vol. 2: 146
Plate 93, fig. 3

LOCAL NAMES. None recorded.

SIZE. Myna ±; length c. 22 cm (9 in.).

FIELD CHARACTERS. Male (adult). Entirely dark slaty with a conspicuous white supercilium to nape. Under tail-coverts and outer rectrices tipped with white.

Male (first-year). Upperparts slaty tinged with brown. Wings, tail, and primary coverts brown, with some black-tipped fulvous feathers. *Below*. Throat- and breast-feathers bluish with white centres.

Female. *Above*, olive-brown with a narrow buff supercilium. Wing-coverts tipped with ochraceous. Outer rectrices broadly tipped white. *Below*, throat buffish speckled with brown, a dark brown stripe on each side. Breast and flanks buff spotted with olive-brown. Centre of belly white.

Both sexes have a large underwing patch, white in male buff in female, noticeable in flight. The prominent supercilium identifies both sexes. Female *Z. wardii* has a more spotted wing, darker breast and flanks barred with blackish brown, not olive-brown.

STATUS, DISTRIBUTION AND HABITAT. Uncommon winter visitor to Manipur hills, locally not uncommon (Hume, SF 11: 132). One record for the Andaman Islands (ibid. 2: 223). Affects hill forest up to at least 1800 m.

Extralimital. Breeds in Siberia from the Yenisey to Amurland. A subspecies (*davisoni*) in Sakhalin and Japan. Winters in southern China, the

¹ A male collected recently (6 Apr. 1972) on Narcondam Island, c. 13° 25' N., 94° 15' E., identified as *Z. s. davisoni*. This differs from nominate *sibirica* in its darker colour, particularly of the upperparts which are almost black in adults instead of slaty grey, in having less white on the belly, and averaging slightly larger (Austin & Kuroda, 1953).

THRUSHES AND CHATS

87

Nepal up to 2300 m (GD). Very local in the plains and only in well-wooded areas. Withdraws from Himalayas in cold weather and winters from the duns and terai south through eastern Punjab (Rohtak), eastern Rajasthan

(Sambhar Lake), Uttar Pradesh and Madhya Pradesh (sparingly in all the preceding localities), Bihar, Bengal, Bangladesh and Assam; also the Eastern Ghats south to Russellkonda (Gumsur). Irregular further south in the Peninsula to Ratnagiri, Tamil Nadu, and Sri Lanka in the low-country Dry zone. Affects damp forest with plentiful but not too dense undergrowth often in the vicinity of streams, mixed secondary and bamboo jungle on valley slopes, and groves of trees near habitations and cultivated country.

Extralimital. The species ranges east through China to Anhwei and south through the Indochinese countries to Borneo and Bali.

MIGRATION. Where a summer visitor, arrives in April/May, leaves in September. On winter grounds from October to March. Passes through Point Calimere (Tamil Nadu), apparently to Sri Lanka, in October.

GENERAL HABITS. Keeps singly or in pairs. Usually shy and difficult to observe. Feeds on the ground hopping about in dense undergrowth, rummaging among fallen leaves and rubbish for insects. When disturbed flies up into a bush or tree where it sits silent and motionless. Feeds till late into the dusk.

86

TURDINAE

Indochinese countries, Burma, Malaya, Borneo (one record) and the Sunda Islands.

MIGRATION. Arrives in winter quarters in October, departs in April.

GENERAL HABITS. In winter usually keeps in small flocks, gathering in larger flocks (up to 60) before spring departure. Very shy and wary. Feeds on the ground, flying up into trees when disturbed.

FOOD. Chiefly insects and worms; fruit (*Ficus*) and berries.

VOICE AND CALLS. Nothing recorded in winter.

BREEDING. Extralimital.

MUSEUM DIAGNOSIS. See Field Characters.

1733. **Orangeheaded Ground Thrush.** *Zoothera citrina citrina* (Latham)

Turdus citrinus Latham, 1790, Index Orn. 1: 350 (India, Cachar)
Baker, FBI No. 587, Vol. 2: 148
Plate 92, fig. 2

LOCAL NAMES. *Mālagir* (Kangra); *Dāmā* (Bengali); *Dookat-gajaniaba* (Cachar).
SIZE. Myna —; length c. 21 cm (8½ in.).

FIELD CHARACTERS. Male. Entire head, nape and underparts orange-chestnut. Vent and under tail-coverts white. Rest of upperparts bluish grey; a white wing-bar; outer rectrices lightly tipped white.

Female. Like male but mantle strongly tinged with olive-brown.

STATUS, DISTRIBUTION AND HABITAT. A partial migrant, fairly common but locally distributed. The outer Himalayas from Murree east through Arunachal Pradesh and south through Assam, Manipur, Bangladesh to the Chittagong Hill Tracts, Bengal south to Calcutta (S. C. Law, *Ibis* 1931: 778), Bihar to the Rajmahal Hills (breeding?) and Uttar Pradesh to Gonda. In the Himalayas breeds from c. 1600 m down to the foothills; in

88

TURDINAE

Courtship Display. 'Male sat on branch motionless like a stuffed dummy, head bowed double till bill-tip almost touching his feet, wings loosely drooped at sides, back arched and tail depressed. Uttered snatches of normal song in soft undertone (almost sub-song), only the tips of his mandibles moving. Female sat about 40 cm away, passive but alert, changing her position abruptly now and again from facing her suitor to a sudden about turn, but entirely silent throughout the serenade. These proceedings, timed for over 15 minutes, were in progress when the observation started and may have continued longer if the birds had not been disturbed' (SA).

FOOD. Insects, worms (especially earthworms), berries and fruit; also leeches locally, but in spite of their great abundance these taken by a few individuals only (GD).

VOICE AND CALLS. A typical thrush song, loud, sweet and variable with some very high-pitched notes, reminiscent of the Blackbird's; contains many successive repetitions of strophes (as in European Song Thrush, *Turdus philomelos*) and faithful imitations of other birds' songs and calls. Uttered chiefly in the morning and evening while sitting motionless, wings drooping at the sides and tail held low; usually given from low trees or down in dense cover. Song period in Nepal, early April till end of August (Proud). A secondary song described as a 'very tuneful, remarkable low melody'. The bird is widely prized as a cage-bird for its song. Alarm-note likened to the shrill screeching noise produced by a pencil on a slate—a high-pitched *krree*.

BREEDING. Season, chiefly May and June (monsoon), occasionally until August. In Assam starts in early April. *Nest and eggs* (c/3 or 4, exceptionally 5) as in 1734. Average size of 100 eggs 25.6 × 19.3 mm (Baker). Brood-parasitism by Pied Crested Cuckoo, *Glammator jacobinus*, recorded (Baker, JBNHS 17: 894).

MUSEUM DIAGNOSIS. See Field Characters. For distinction from *cyanotus* see 1734, Museum Diagnosis.

Young. *Above*, head dull rufous-brown with pale centres and dark edges to the feathers. Upperparts dark grey with pale centres to scapulars. *Below*, pale yellowish rust with faint blackish tips to the feathers; tips of median and greater coverts rusty white. Wings and tail as adult. Postjuvinal moult complete, about October.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	113-126	23-25	29-33	{ 70-83 mm
♀♀	114-123			{ 72-81 mm
				(BB, HW)

Weight 5 ♂♂ (October) 56-66.5; 2 ♀♀ (October) 57, 67.5 g (GD, Nepal).
8 ♂♂ (October) 48-58 (av. 52.7); 8 ♀♀ (October) 50-60 (av. 54.4) g—SA.

COLOURS OF BARE PARTS. Iris dark brown. Bill dark horny to black. Legs fleshy with brownish front, or light horny brown with yellowish behind; feet fleshy to light horny brown; claws fleshy to horny; toes fleshy or yellowish fleshy (BB).

89

1734. **Whitethroated Ground Thrush.** *Zoothera citrina cyanotus* (Jardine & Selby)

Turdus cyanotus Jardine & Selby, 1828, Ill. Orn. I, pl. 46 (India, Bangalore)
Turdus citrinus emadoni Biswas, 1951, Jour. Bombay nat. Hist. Soc. 49: 661
 (Chanda, Central Provinces)¹
 Baker, FBI No. 588, Vol. 2: 150

Plate 92, fig. 3

LOCAL NAMES. *Mālagir kātīro* (Gujarati); *Kōzhikkili*, *Koori kaman kattupulleh* (Malayalam).

SIZE. Myna — ; length c. 21 cm (8½ in.).

FIELD CHARACTERS. As in 1733 but throat white and ear-coverts whitish with two oblique dark brown stripes. Wings have a white shoulder-bar and whitish edge. White-and-black head pattern is diagnostic.

STATUS, DISTRIBUTION and HABITAT. Resident and also local migrant; fairly common. Peninsular India from southeastern Gujarat (Navsari and Dangs districts, SA, JBNHS 52: 770; Shull, ibid. 59: 659), Madhya Pradesh (Satpura Range, apparently not in the Vindhya Range), 'Bihar' (Hodgson) and Orissa (Sambalpur, Mahendragiri, Jeypore) south through Maharashtra, Andhra Pradesh, Tamil Nadu, Karnataka and Kerala. In the hills up to c. 1200 m, locally 1500 m. Curiously not Sri Lanka where only the more northern nominate race is an occasional winter visitor. Affects forest, shady ravines and nullahs, dank cardamom sholas, coffee plantations, mixed secondary and bamboo jungle, and occasionally well-wooded gardens.

GENERAL HABITS. As in 1733. Quiet and unobtrusive. Markedly crepuscular; spends the day in shady thickets and bamboo jungle, often coming out at dusk to feed on forest roads and tracks, hopping about and flicking aside dry leaves etc. in the quest.

Display. 'Male stands very erect and rigid on a bough beside its mate, with head bent stiffly and tucked into the breast feathers as it sings vigorously' (Betts).

FOOD. As in 1733.

VOICE and CALLS. As in 1733. A clear rollicking song of several rich whistling notes and frequently reiterated phrases, into which are rolled the mimicked calls and songs of many other birds, e.g. Redwhiskered Bulbul, Tailor Bird, Quaker Babbler, Spotted Babbler, etc. Delivered chiefly in the mornings and evenings from well up in a tree. Alarm-note, a subdued high-pitched *kreeee*.

BREEDING. Season, May to September, chiefly June to August (monsoon). Nest, a thick pad or shallow cup of moss, roots and twigs, usually intermixed with a certain amount of mud, lined with rootlets and leaf stems; placed in a fork of a sapling, coffee bush or tree, between one and four metres above the ground; preferably in an open situation like forest edge rather than in the interior of shrubbery. Eggs, 3 or 4, pale green [or pale stone colour] speckled and blotched with reddish brown. Average size of 40 eggs 25 × 18.5 mm (Baker). Nest-building and incubation by both sexes but

¹ But see Abdullali, H., 1965, JBNHS 62: 305-6. Differences still seem clinal in character to me — SDR.

THRUSHES AND CHATS

91

FIELD CHARACTERS. As in 1735, also with white throat and no white on wing. See Museum Diagnosis.

STATUS, DISTRIBUTION and HABITAT. Fairly common resident: Nicobar Islands. Affects dank jungle, forest and village clearings.

GENERAL HABITS, FOOD and VOICE. As in 1733, q.v.

BREEDING. Unrecorded, probably as in 1735.

MUSEUM DIAGNOSIS. As *andamanensis* sex for sex but rufous colour darker, more chestnut, especially on head. Chin and throat white. No white on wing.

MEASUREMENTS

	Wing	Tarsus	Tail
♂ ♀	100-106	c. 31	66-72 mm (Baker)

COLOURS OF BARE PARTS. As in 1733.

1737. **Spottedwinged Ground Thrush.** *Zoothera spiloptera* (Blyth)

O. (trocinela) spiloptera Blyth, 1847, Jour. Asiat. Soc. Bengal 16: 142 (Ceylon)
 Baker, FBI No. 602, Vol. 2: 165
 Plate 93, fig. 2

LOCAL NAMES. *Wāl arichchiyā*, *Gomā arichchiyā* (Sinhala).

SIZE. Myna — ; length c. 21 cm (8½ in.).

FIELD CHARACTERS. Above, olive-brown with two rows of white spots on wing. Cheeks whitish with two dark brown stripes. Below, creamy white boldly spotted with dark brown, especially on breast and upper belly. Flanks olive-brown. Sexes alike.

Distinguished from female *Z. wardii* (1731) by cheek-stripes, lack of prominent supercilium and spotted rather than barred underparts.

STATUS, DISTRIBUTION and HABITAT. Endemic to Sri Lanka. Resident in moderate numbers, but locally distributed; throughout the hills up to c. 1500 m (Phillips) or 1800 m (Henry), and in the low-country Wet zone to the south and southwest almost to the coast; optimum zone 600-1200 m. Very scarce in the Dry zone forests to the north. Affects forest or well-wooded country (e.g. cardamom jungle, cacao estates, etc.).

GENERAL HABITS. Solitary. Feeds on the ground, vigorously turning over dead leaves in search of prey.

FOOD. Worms, insects, etc., and probably also berries.

VOICE and CALLS. Has a rich, sweet and varied song, usually uttered from the lower branches of trees. A feeble call-note.

BREEDING. Season, two distinct periods: February to May and August to December, the second seemingly the principal breeding season. At least two broods are reared. Nest, a cup of green moss with a few twigs, decayed

× c. 1

90

TURDINAE

apparently more by female. Incubation period 13 to 14 days. Care of young by both parents. Young remain in nest for c. 12 days.

MUSEUM DIAGNOSIS. Differs from *citrina* (1733) in having the ear-coverts whitish with two dark brown oblique stripes, the crown suffused with olive, and the throat white.

Female, like male but mantle strongly tinged with olive.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂ ♂	106-119	20-25	20-33	72-80 mm
♀ ♀	102-116	(mostly 23-24)	28-29	67-77 mm (HW, SA, Koelz)

Weight 20 ♂ ♀ 47-60 (av. 53.3) g — SA.

COLOURS OF BARE PARTS. Iris dark brown; bare skin behind eye slaty brown, base of lower mandible flesh; mouth fleshy pink, greyish pink or yellowish pink. Legs, feet and claws brownish flesh.

1735. **Andaman Ground Thrush.** *Zoothera citrina andamanensis* (Walden)

Geocichla andamanensis Walden, 1874, Ann. Mag. Nat. Hist. 14: 156 (Andamans)
 Baker, FBI No. 590, Vol. 2: 152

LOCAL NAMES. None recorded.

SIZE. Myna — ; length c. 20 cm (8 in.).

FIELD CHARACTERS. As in 1733 but throat whitish; no white on wing.

STATUS, DISTRIBUTION and HABITAT. Common resident: Andaman Islands. Affects heavy forest.

GENERAL HABITS, FOOD and VOICE. As in 1733, q.v.

BREEDING. Season, May to July. Nest and eggs (normally c/3) as in 1734; for details see Baker, *Nidification* 2: 133. Average size of 100 eggs 25.1 × 18.5 mm (Baker).

MUSEUM DIAGNOSIS. Sex for sex like nominate *citrina* (1733) but rufous colour darker, chin and throat whitish; a trace of dark bars on cheeks; no white on wing. Size smaller.

Fledgling. 'Olive-grey above, head, neck and back streaked with buff, most broadly on neck; the two stripes below eye almost black and very distinct; upper breast with buff feathers edged with olivaceous; remaining lower parts buff' (Butler, JBNHS 12: 556).

MEASUREMENTS

1741. Smallbilled Mountain Thrush. *Zoothera dauma dauma* (Latham)

Turdus Dauma Latham, 1790, Index Orn. 1: 362 (India = Kashmir)

Baker, FBI No. 595, Vol. 2: 158

Plate 93, fig. 8

LOCAL NAMES. None recorded.

SIZE. Myna + ; length c. 26 cm (10½ in.).

FIELD CHARACTERS. Above, olive-brown with buff and black crescent-shaped markings. Closed wings with buff and dark brown bars. A large buff wing-patch on the under surface of wing showing prominently in flight. Below, throat and belly white, breast and flanks buff boldly marked with dark brown crescentic spots. Sexes alike.

The only thrush with a spotted back.

STATUS, DISTRIBUTION AND HABITAT. Altitudinal and short-range migrant, fairly common. The Himalayas from Murree and Kashmir east to Bhutan

7

THRUSHES AND CHATS

99

dry leaves in quest of food. From time to time wags posterior part of body violently up and down, jerking open tail and suddenly opening and shutting wings in order to stampede lurking insects. Flies silently up into the lower branches of a tree when disturbed, remaining there motionless and difficult to spot. Flight reminiscent of Plaintive Cuckoo or Hawk-Cuckoo, with the same upward glide before alighting on a branch.

FOOD. Insects and their larvae, and berries.

VOICE AND CALLS. A fine loud song reminiscent of the Missel Thrush's but more disconnected, a long pause coming between each phrase: *chirrup* ... *cheewee* ... *chueu* ... *wiow* ... *we ep* ... *chirrol* ... *chup* ... *cheewee* ... *wiup* (Magrath). Also described as 'a few fine notes connected by a curious medley of squeaks and chuckles ... for hours together with very little variation' (Proud). Song period (in Nepal) early April to mid June. Other notes not recorded.

BREEDING. Season, end of April to June. Nest, a wide cup of green moss mixed with rootlets, leaves and grass, lined with rootlets or stalks of maiden-hair fern; placed in a fork of a tree or bush usually between one and six metres from the ground, occasionally in a bank among stones covered with moss and undergrowth.¹ Eggs, 3 or 4, pale clay to yellowish green densely freckled with pale reddish. Average size of 25 eggs 30.5 × 22.3 mm (Baker). Share of the sexes in the domestic chores, and incubation period, unrecorded.

MUSEUM DIAGNOSIS. See Field Characters. In summer the upperparts are greyer and the underparts lose some of the ochraceous tinge (HW). Rectrices 12; occasionally 14 in eastern part of range.

Young, very like adult but markings below are more bars than crescents. Upperparts with golden bars and black tips; lesser wing-coverts with more definite ochraceous streaks. Postjuvénal moult of body-feathers, lesser and apparently inner median and inner greater coverts.

MEASUREMENTS

TURDINAE

and Arunachal Pradesh (?); also in the Garo, Khasi and Cachar hills, and Manipur. Breeds above 2100 m around Murree, between 2400 and 3000 m in Kashmir, possibly up to 3600 (tree-limit) in Garhwal, and from 2400 to 3300 m in Bhutan. No summer data for Arunachal and Nepal (cf. Biswas, 1961; Diesselhorst, 1968). Winters (November to April) from c. 1800 m down to the foothills (once Peshawar), terai and sparingly south to Madhya

Zoothera dauma

Distributional ranges

	<i>dauma</i> (1741). Breeding		<i>dauma</i> , Winter; only India and Burma shown
	<i>neilgherriensis</i> (1742)		
	Extralimital subspecies		<i>imbricata</i> (1743)

Pradesh (Gwalior), eastern Maharashtra (Kamptec), Raipur, Orissa (Sambalpur, Simlipal Hills, Ganjam), Bihar (Madhubani), and southern Bengal; also the plains of the Brahmaputra, the Garo, Khasi and Mizo hills, and Bangladesh south to the Chittagong region. In the summer affects heavy forest of *kharshu* oak and silver fir; in winter dense forest with grassy clearings, dense jungle with undergrowth of bracken or seedlings, edges of pasture-land and sal forest; also well-wooded banks of streams, bamboo brakes, mango topes, etc.

Extralimital. Extends north through Szechuan, east to Kwangsi, Laos and Vietnam. Disjunct subspecies in southern India and Sri Lanka. Many other subspecies in the southern Indochinese countries, Indonesia, New Guinea, northern and eastern Australia and Tasmania; also Taiwan, Japan, Manchuria and southern Siberia from Amurland to the Ural Mts (ssp. *aurea*).

GENERAL HABITS. Keeps singly or in pairs. A quiet, retiring bird generally seen hopping about on the forest floor or along paths, turning over

100

TURDINAE

1742. Nilgiri Thrush. *Zoothera dauma neilgherriensis* (Blyth)

O. (rocincla) neilgherriensis Blyth, 1847, Jour. Asiat. Soc. Bengal 16: 141 (Neilgherries)

Baker, FBI No. 596, Vol. 2: 159

LOCAL NAME. *Kozhikkilippunan* (Malayalam).

SIZE. Myna + ; length c. 26 cm (10½ in.).

FIELD CHARACTERS. As in 1741 but upperparts without buff spots.

STATUS, DISTRIBUTION AND HABITAT. Uncommon resident. The Western Ghats complex in southern India from Goa (?) and northern Karnataka (Londa, Koel, JBNHS 43: 15), the Biligirirangan Hills and Coorg district south through Kerala and western Tamil Nadu (Nilgiri, Palni and associated hills) from c. 600 to 2100 m. Affects dense evergreen sholas and forest.

GENERAL HABITS, FOOD AND VOICE. As in 1741, q.v.

BREEDING. Season, March to June. Nest, as in 1741. Eggs 2, rarely 3, similar to those of 1741 but as a series darker, duller and browner, and more feebly marked. Average size of 10 eggs 32.5 × 23.2 mm (Baker).

MUSEUM DIAGNOSIS. Differs from *dauma* in being much darker above, lacking the golden-buff spots almost entirely.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♀	124-136	27-29	28-29	81-92 mm (Baker)

COLOURS OF BARE PARTS. Iris hazel to dark brown. Bill: upper mandible dark horny brown, lower pale horny brown, darker at tip. Legs and feet fleshy to horny white.

1743. Ceylon Scaly Thrush. *Zoothera dauma imbricata* Layard

Zoothera imbricata Layard, 1854, Ann. Mag. Nat. Hist. 13: 212 (Ceylon)
Baker, FBI No. 597, Vol. 2: 160

LOCAL NAME. *Wd' arichchiya* (Sinhala).

SIZE. Myna ± ; length c. 24 cm (9½ in.).

FIELD CHARACTERS. As in 1741 but upperparts olive-brown with black crescent-shaped marks, no buff spots. Lower parts rufous-buff.

The Spottedwinged Thrush (1737) is distinguished from it by its plain, unspotted back.

STATUS, DISTRIBUTION AND HABITAT. Resident, in small numbers in the hills of Sri Lanka between c. 600 and 1500 m, mostly above 900 m. Affects dense forest.

GENERAL HABITS, FOOD AND VOICE. As in 1741, q.v.

BREEDING. Season, March to May and July to October. Possibly double-brooded. Nest and eggs (c2), as in 1741. Average size of 6 eggs 30.5 × 21.2 mm (Baker). Incubation apparently by female only.

THRUSHES AND CHATS

101

MUSEUM DIAGNOSIS. Differs from the Nilgiri Thrush (1742) in being darker above and in having the underparts rufous-buff instead of white and the crescentic black edges to the feathers narrower.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail

1744. Golden Thrush. *Zoothera dauma aurea* (Holandre)

Turdus aureus Holandre, 1825, Faune dép. Moselle, Ann. de la Moselle: 60 (Metz) Baker, FBI No. 598, Vol. 2: 161

LOCAL NAMES. None recorded.

SIZE. Myna +; length c. 27 cm (12 in.).

FIELD CHARACTERS. As in 1741, q.v.

STATUS, DISTRIBUTION AND HABITAT. Winter vagrant, one record: Dibrugarh, Assam, 12 February 1905 (W. Moore, JBNHS 16: 502). The bird was obtained in *ekra* jungle.

Extralimital. See 1741. This subspecies winters in southern China and northern Indochinese countries.

GENERAL HABITS, FOOD AND VOICE. Probably as in 1741.

MUSEUM DIAGNOSIS. Similar to *dauma* but larger. Tail with 14 rectrices (v. usually 12). For details of plumage see Dementiev.

MEASUREMENTS

	Wing	Bill (from skull)	Tail
11 ♂ ♀	151-165 (av. 156.9)	27-31	112-118 mm

Weight 3 ♂♂ 101, 146.5, 162 (av. 136.5); 1 ♀ 128 g — Dementiev.

COLOURS OF BARE PARTS. Iris brown. Bill brownish, yellowish at base. Legs and feet yellowish brown.

1745. Large Brown Thrush. *Zoothera monticola monticola* Vigors

Zoothera monticola Vigors, 1832, Proc. Zool. Soc. London: 172
(Himalayas = Simla-Almora area)

(Khasi Hills) and 2600-3000 m (Mt Victoria). Winters (November to March) between 1500 and 2000 m (Simla), down to c. 300 m (Nepal) and from the duars and foothills of Jalpaiguri district up to 2900 m in Sikkim and Bhutan. Affects small mountain streams running through dense forest, and dense, matted undergrowth of bamboo, rhododendron, etc. on swampy ground in damp forest.

Extralimital. Extends to the Chin Hills and the Myitkyina district of Burma. Another subspecies in northern Vietnam.

GENERAL HABITS. Keeps singly. Haunts dark dense forest undergrowth where its coloration is astonishingly obliterative, only movement giving it away. A quiet bird of crepuscular habits, feeding on the swampy margins of wooded streams and damp forest floor, tossing leaves about with its large bill, or turning over stones in stream-beds. It is a busy bird whilst feeding, moving back with its tail lowered when a stone is displaced, and then darting forward with its tail cocked and seizing any worm or insect exposed by the removal of the stone. The favourite hunting ground of this thrush appears to be accumulations of ooze and gravel at the base of boulders... The flight is generally up or down stream, but when much disturbed darts through thick underwood and makes for the next nullah... I have never seen one away from the immediate vicinity of a well-wooded nullah... Flight rapid, more like that of dipper than thrush' (S. J. Martin, JBNHS 26: 668).

FOOD. Insects and their larvae, snails, berries.

VOICE AND CALLS. Not adequately described. Said to have 'a beautiful mellow whistle'.

BREEDING. Season, May to July. Nest, a bulky cup of fresh damp moss mixed with earth and leaves with an inner layer of roots and twigs; lined with rootlets, lichen and soft fibres. Placed in a fork or horizontal branch of a moss-covered tree between two and five metres above the ground, sometimes up to seven metres. Occasional nests may be placed among moss and ferns against tree-trunks (once against the face of a huge boulder). Eggs, 3 or 4, pale grey-green to pale olive-green, or pale cream to warm buff, marked with reddish brown specks or small blotches. Average size of 50 eggs 30 × 21.3 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters.

Young. Upperparts blackish brown with pale shaft-streaks; lesser, median and greater coverts with ochraceous tips. Underparts much as in adult. Postjuvinal moult of body-feathers, lesser, median and inner greater coverts.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail

(Nichuguard, Naga Hills)

Baker, FBI No. 604, Vol. 2: 168

Plate 95, fig. 3

LOCAL NAME. Daokat-buku-lowia (Cachari).

SIZE. Myna +; length c. 25 cm (10 in.).

FIELD CHARACTERS. A stout, large-billed, short-tailed thrush. Above, rufescent olive-brown. Below, sides of head mottled whitish and brown. Throat whitish, a dark brown streak on each side. Breast and belly buffish white scalloped with olive-brown. Flanks olive-brown with whitish streaks. A buff underwing patch visible in flight. Sexes alike.

For distinction from *Z. monticola* see 1745.

STATUS, DISTRIBUTION AND HABITAT. Uncommon resident, subject to short vertical movements. The lower Himalayas from western Nepal (Rand & Fleming, 1957; Biswas, 1961) eastward through northern Bengal (Darjeeling and Jalpaiguri districts), Sikkim, Bhutan and Arunachal Pradesh

Zoothera marginata

▨ Distributional range

(Stevens, JBNHS 23: 262); thence south through Nagaland (Koelz, loc. cit.), Meghalaya, Manipur and Mizoram south to the Chittagong Hill Tracts of Bangladesh (Rashid). Recorded in winter from 1900 m (Sikkim) down to the foothills, the Nepal bhabar and the plains of the Brahmaputra. Presumably breeds in the higher parts of this zone (upper duns of Nepal, Sikkim about 1500 m). More common south of the Brahmaputra where

THRUSHES AND CHATS

105

it breeds between c. 750 and 2100 m. Affects damp forest along small water-courses; in winter also dense reed-jungle along the banks of sluggish streams in evergreen forest (plains of Lakhimpur).

Extralimital. Extends east to Vietnam.

GENERAL HABITS. Similar to those of *Z. monticola* (1745). Very retiring and crepuscular.

FOOD. Chiefly insects and molluscs.

VOICE AND CALLS. Unrecorded.

BREEDING. Season, May to August. Nest cup-shaped, made chiefly of moss mixed with some rootlets, twigs and stems, and lined with rootlets; similar to that of *Z. monticola* but more neatly built. Eggs, 3 or 4, like those of *Z. monticola* (1745, q.v.) but 'more handsome and much more varied'. For details see Baker, *Nidification* 2: 147. Average size of 50 eggs 27 × 20 mm. Incubation by both sexes; other details of breeding biology unrecorded.

MUSEUM DIAGNOSIS. See Field Characters.

Young birds have the upperparts darker, streaked with fulvous on back. Tips of wing-coverts fulvous. Underparts buffish, the feathers tipped with blackish, very heavily on breast.

MEASUREMENTS

growth, mixed oak and rhododendron forest with trees overgrown with moss, orchids and ferns in rocky ravines (Meghalaya), or in light pine forest without undergrowth on rocky slopes (Mt Victoria). In winter also noted in scrub jungle.

Extralimital. Extends to Yunnan and northern Vietnam.

GENERAL HABITS. Very shy and elusive. Keeps almost entirely to the interior of forest. Feeds mostly on the ground, rummaging among fallen leaves.

FOOD. Insects, snails, slugs and berries.

VOICE AND CALLS. Alarm-note a sharp resounding *tock, tock, tock, tock* (Heinrich). 'A sweet but not very powerful song.' Can be heard a great distance off and, in the breeding season, kept up for hours (Whistler).

BREEDING. Season, April to July. Nest, a well-built cup of green moss with an inner layer of grass, roots and a few dead leaves, rarely with some mud, lined with rootlets; placed in a fork of a dense tree or high bush between one and six metres above the ground; occasionally on the ground itself (Hopwood & Mackenzie, JBNHS 25: 86). Eggs, normally 4, sometimes 3, very variable, pale green to buff, more or less marked with deep red or purple-brown blotches. Average size of 50 eggs 26.8 × 19.8 mm

(Mawphlang, Khasi Hills)

Baker, FBI No. 579, Vol. 2: 138

Plate 92, fig. 6

LOCAL NAMES. *Kästür*, *Käs künr* (Kashmir); *Diri pūrdi* (Hindi); *Machasah* (Bengali).

SIZE. Myna ±; length c. 21 cm (8½ in.).

FIELD CHARACTERS. **Male.** A small, plain ashy grey Himalayan thrush, paler on breast, white on belly. Under wing-coverts rufous. In the Peninsula in winter may be mistaken for a female Blackbird but the latter is more olive-brown and has a lightly streaked throat.

Female. *Above*, olive-brown; lores, a faint supercilium and eye-ring buff. *Below*, throat white, sides streaked with brown; a broad, pale olive-brown band across breast with a few dark brown streaks; flanks tawny-olive; belly and under tail-coverts white. Distinguished from female Blackbird by tawny flanks and white throat.

STATUS, DISTRIBUTION AND HABITAT. Common summer (breeding) visitor to the Himalayas from N.W.F.P. (Chitral) east through Kashmir to Nepal (uncommon) and Sikkim (breeding?). Breeds between c. 1800 and 2700 m (Chitral), 1500 and 1800 m, occasionally 2200 m (Kashmir), 1200 and 2100 m (Kangra to Simla), 1500 and at least 2100 m (Nepal and Sikkim), overall optimum zone 1500-1800 m. Winters to the east and south-east of its main breeding grounds, from Kangra (occasionally) along the foothills to Arunachal Pradesh (Subansiri Betts, JBNHS 53: 405), and in the Peninsula to eastern M.P. (Bastar, Raipur), Orissa (Mayurbhanj,

THRUSHES AND CHATS

109

Nilgiri — SA), northeastern Andhra (Anantagiri), southern Bengal and Bangladesh in the Chittagong region (Rashid). Regular winter visitor also to northern Baluchistan (Quetta, Fort Sandeman, Loralai — Christison, JBNHS 43: 479). In summer affects open deciduous forest on grassy ground or with little undergrowth, willow groves, orchards and gardens (very common about Srinagar, Kashmir). In winter frequents edges of forest and, in the Peninsula, groves and well-wooded areas.

MIGRATION. Arrives on breeding grounds at the end of March and April, departs in September and October. In autumn migrates eastwards along the Himalayas between c. 2100 m and the foothills. Less in evidence during spring migration. Has straggled to Ladakh, 3000 m in April, Jacobabad [?] (February), Sambhar Lake and Mt Abu (September), Bharatpur (Nov.—Feb. — apparently fairly regular) and Khandala [?] (November).

GENERAL HABITS. Keeps in pairs or in small flocks according to season. Feeds on the ground in the typical thrush manner, spurring a metre or two at a time by a series of short speedy hops or quick mincing steps, then stopping with head cocked to one side as if to gaze intently at the turf or listen for underground movement before thrusting into the ground with the bill to extract a worm. When disturbed flies silently up into a nearby tree. Like the Blackbird, has a habit of 'scolding' while preparing to roost for the night.

FOOD. Insects, earthworms, berries and fruit (apples, plums, etc. especially windfalls). Vegetable food apparently forming major part of diet (GD).

VOICE AND CALLS. Alarm-note *juk-juk*, uttered also when food-hunting. Song typically thrush-like, of short rich notes, *wiw-wiw-wiw... keek-keek*, invariably reiterated twice or 3 or 4 times followed by short typical thrush chatter as interval. Repeated monotonously from stump near tree-top, maybe for ten minutes or more at a stretch (SA). Also rendered as *chellya*, *chellya*, *chirrali* — *cherlyu*, *cherlyu*, *chellya* — *chellya*, *chellya*, *juliu* (Magrath). Song apparently very variable in melody locally; but on the whole rather monotonous and much inferior to that of, e.g. Greywinged Blackbird. Given chiefly early morning from before dawn, and evening until dusk. Song period, end of March to mid August (Proud).

BREEDING. Season, April to August. Nest a deep cup of moss, roots and dry grass lined with rootlets and finer grass; generally placed in the fork of a tree between two and seven metres above the ground, sometimes lower in bushes or in a hollow in a bank. Eggs, usually 3 or 4, sometimes 5, very variable, pale green to pale buff profusely blotched over the whole surface with reddish brown. Average size of 89 eggs 27.1 × 19.3 mm (Osmaston), of 80 eggs 27.8 × 19.5 mm (Baker). Feeding of young by both parents. Share in other duties not recorded.

MUSEUM DIAGNOSIS. See Field Characters.

Young (male and female). Upperparts darker brown than in adult female, all except rump and upper tail-coverts with pale shaft-streaks; lesser, median and greater coverts brown with ochraceous tips. Below, chin, throat and belly white tinged ochraceous; sides of throat, breast and flanks with heavy blackish terminal bars and tinged with ochraceous; under wing-coverts and axillaries ochraceous. Postjuvénal moult of body-feathers, lesser, median and part of greater coverts. Postnuptial moult complete, about August.

THRUSHES AND CHATS

111

Turdus albocinctus

Distributional range

Breeding

Winter

Extralimital range little known

feed a good deal in trees; also on the forest floor, and in winter on lawns in gardens and close to villages.

FOOD. Insects, fruit and berries (crab apples, hawthorn, holly and cotoneaster berries recorded). Vegetable food probably predominant in autumn and winter.

VOICE AND CALLS. Song mellow but less varied than that of the Blackbird; usually given from the top of a tall tree. Song of one individual recorded by Deshayes as uttered in several bursts of notes on a descending scale: *teu-i, teu-u, teu-o*, etc., with variations. Song period mid April at least till July (Proud). Alarm-notes a throaty *tuck-tuck-tuck-tuck* as characteristic of other thrushes; often uttered while going to roost and again at dawn, like the Blackbird in the same circumstances.

BREEDING. Season, early May to July. Nest, a massive cup of moss with some grass, rootlets and leaves incorporated, lined with dry grass or rootlets; built on a stout branch or in a fork, sometimes in large cavities of trees beaten down by snow, between one and three metres above the ground or even on the ground itself at the foot of a mossy stump, often blending perfectly with the surrounding moss. Eggs, 3 or 4, very similar to the Blackbird's but larger and rather more boldly blotched. Average size of 100 eggs 30.5 × 21.7 mm (Baker). Female only has an incubation patch (GD).

MUSEUM DIAGNOSIS. See Field Characters.

Young. Upperparts and sides of head brown with ochraceous shaft-streaks on head and mantle. Wing-coverts brown, all except primary with ochraceous tips. Wings and tail as adult sex for sex. Underparts pale ochraceous with heavy dark brown tips; throat more or less immaculate.

Baker, FBI No. 570, Vol. 2: 129

Plate 92, fig. 9

LOCAL NAMES. *Kündoo kástūra* (Hindi); *Charehar* (Paharia, for all blackbirds and rock thrushes).

SIZE. Myna + ; length c. 27 cm (11 in.).

FIELD CHARACTERS. Male. An entirely black or blackish brown thrush with a broad white collar around neck and upper back. Throat white. Under tail-coverts black with white shaft-streaks. Legs and feet yellow.

Female has a collar as in male but dull ashy in colour. Rest of plumage rufous-brown, paler below, the feathers pale-fringed, producing a scaly effect.

STATUS, DISTRIBUTION AND HABITAT. Common resident, subject to vertical movements. The Himalayas from Chamba and Duala Dhar east through Arunachal Pradesh, possibly to Nagaland (specimen collected at end of April). Eggs found by Rattray about Murree *sic* Baker, *Nidification* 2: 116. Breeds between 2700 and 3300 m (Duala Dhar), 2100-3200 m (Simla, Garhwal), 2400-3600 m (Nepal), up to 4000 m (Sikkim), 2700 and 3600, locally up to 4200 m (Bhutan, Arunachal). Winters between c. 2400 and 1500 m (western Himalayas), up to 3000 m (Nepal, Sikkim), down to the base of the hills (Arunachal) and reaching the Cachar and Khasi hills, Nagaland and Manipur but rarely lower than c. 900 m. Affects *kharsu* oak—horsechestnut—rhododendron forest, open coniferous or mixed broad-leaved and conifer forest, especially margins and clearings with plenty of undergrowth; in southeastern Tibet also frequents dwarf rhododendron near tree-line 'in the same surroundings as *Turdus merula maximus*' (Ludlow).

Extralimital. Southeastern Tibet to southwestern Szechuan.

GENERAL HABITS. Keeps singly or in pairs; outside the breeding season sometimes in flocks, either by themselves or with other thrushes. Shy and wary on breeding grounds; more confiding in the cold season. Appears to

SIZE. Myna + ; length c. 28 cm (11½ in.).

FIELD CHARACTERS. Male. Overall black, with a large and distinctive

× c. 1

pale grey wing-patch; belly and under tail-coverts with whitish fringes. Eye-rim yellow, bill orange.

Female brownish ashy tinged with olivaceous; grey wing-patch of male replaced by rufous-brown.

STATUS, DISTRIBUTION AND HABITAT. Common resident, subject to vertical movements. The Himalayas from Murree east through Nepal, Sikkim, Bhutan and Arunachal Pradesh; thence south to the hills of Cachar. Breeds between 1800 and 2300 m (Murree), and up to 2700 m farther east (observed at 3300 m in eastern Nepal — GD); in Cachar breeds about 1200-1400 m. Winters (November to March) between 1200 and 2100 m in the western Himalayas, occasionally reaching the foothills and entering adjacent plains (Salt Range, Lahore, Ludhiana, Chandigarh, Ambala), occasionally straying farther south (Bharatpur, Rajasthan — JBNHS 65: occasionally in winter between 2400 and 2600 m near Naini Tal (Meinertzhagen) and in Nepal above 2100 m, but also regularly descending

THRUSHES AND CHATS

113

to the duns and terai. In Sikkim, Darjeeling dist., and Bhutan winters from c. 1800 m down to the foothills, commonly entering the plains of northern Bengal (Jalpaiguri duars). Farther east reaches Nagaland, Manipur, the Khasi and Cachar hills south to Hailakandi. Affects humid broad-leaved

Turdus boulboul

Distributional range

■ Breeding

■ Winter

forest of oak, rhododendron, etc. Apparently prefers denser forest than *T. albocinctus*. In winter frequents woods, bush jungle and village precincts. *Extralimital*. Extends east to northern Vietnam and Kwangsi. Winters to Burma and Thailand.

GENERAL HABITS. Keeps singly or in pairs in the breeding season, singly or in small flocks in winter; in this season sometimes in company with other thrushes. Feeds mostly on the ground. Rather shy and retiring. Males become pugnacious during nesting season, and intolerant of others of their kind.

FOOD. Insects, earthworms, berries and fruit.

VOICE AND CALLS. Song rich, fluty and far-carrying — of great variety and mellowness, reminiscent of the Blackbird's. It consists of one soft introductory note followed by four high-pitched ones on a descending scale. For details see Lister, JBNHS 52: 39. Song period mid March to mid August (Proud). Alarm-notes, the typical Blackbird chuckles *chūk, chūk, chūk*, and an angry *churr* near nest.

Is one of our finest songsters and a favourite cage bird, especially in Kashmir and Punjab.

BREEDING. Season, March to August. Double-brooded. *Nest*, a bulky cup of moss, leaves, grass and tendrils, often but not always with a layer of mud,

114

TURDINAE

lined with dry grass or rootlets, generally placed in the fork of a horizontal branch of a tree between two and five metres from the ground; sometimes in banks or among the roots of a fallen tree. *Eggs*, 3 or 4, pale green blotched over the whole surface with pale red-brown. Average size of 50 eggs 29 × 20.9 mm (Baker). Building of nest and care of young by both parents. Incubation apparently by female only; period undetermined.

MUSEUM DIAGNOSIS. See Field Characters.

Young male. Upperparts, ear-coverts and sides of neck, lesser wing-coverts and under tail-coverts blackish brown, all except rump and upper tail-coverts with pale shafts. Underparts ochraceous, all feathers except on chin and throat boldly fringed with blackish brown; on flanks, the ochraceous reduced to narrow streaks. Median coverts blackish brown with large ochraceous tips and shafts. Outer webs of greater coverts and inner secondaries fulvous grey with pale shaft-lines at the tip of the former. Flight-feathers and tail as in adult but not so pure black.

Young female like male but rufous-olive replaces blackish brown of plumage and fulvous grey of wings. Postnuptial moult of body-feathers, lesser, median and ? greater coverts. A complete moult apparently takes place in spring.

Baker, FBI No. 565, Vol. 2: 123

Plate 92, fig. 13

LOCAL NAMES. None recorded.

SIZE. Myna +; length c. 27 cm (11 in.).

FIELD CHARACTERS. Male entirely black with a yellow bill. Female dark brown with a brown bill.

STATUS, DISTRIBUTION AND HABITAT. Resident, subject to short downward movements in winter; common locally but scarce in the more humid central Himalayas. From N.W.F.P. (Whitehead *opud* Baker) and Baltistan (Ludlow MS.) east through Arunachal Pradesh. Breeds between 3000 and 3600 m (Kohat), 3300 and 4000 m (Hazara, Kashmir), [an observation at 2800 m in May in Kangra], 3600 and 4000 m (Garhwal — Whymper, JBNHS 20: 1158), about 4200 m (Nepal — Deshayes, JBNHS 67: 571; *Ibis* 1965: 400), 3600 and 4500 m (Sikkim and adjacent parts of Tibet — *Ibis* 1922: 50 and JBNHS 32: 322), 3400 and 4500 m, more common 4000-4500 m (Bhutan and southeastern Tibet — Ludlow). In winter (November to April) recorded as high as 4600 m in Sikkim and down to 2100 m in southeastern Tibet, but not below 3000 m in the central and western Himalayas, where winter records are very scanty. Prefers drier areas and may winter more commonly on the northern slopes. In summer affects dwarf juniper, dwarf rhododendron and other scrub on steep rocky slopes above timber-line, and boulder-strewn alpine meadows.

Extralimital. Adjacent parts of northern Afghanistan (Yate & Scully, 1887, *Jour. Asiatic Soc. Bengal*) — where presumably intergrading with *intermedius* — and southeastern Tibet. The species ranges west to the British Isles, Morocco and the Azores, and east through southern China. Also the hills of the Indian Peninsula and Sri Lanka (1754-1757).

GENERAL HABITS. Keeps singly in the breeding season, in family groups after breeding, and singly or in small flocks of 5 to 12 birds in winter; in this season sometimes in company with other thrushes. Other habits typical of the blackbirds and related thrushes. As a rule wild and wary, taking off while yet a considerable distance away, flying low over the ground and soon curving out of sight.

FOOD. Insects, caterpillars and berries (juniper, wild rose, etc.); once small lizards (RM).

VOICE AND CALLS. Song, similar to that of the European subspecies but neither so powerful nor so pleasing (Ludlow). A very silent bird; song not often heard. Has a characteristic low *chut-chut* and a rattling alarm-note, less loud, harsh and squeaky than that of *T. m. merula* (Magrath).

THRUSHES AND CHATS

117

BREEDING. Season, May to July. *Nest*, a bulky structure of dry grass and moss with a little mud in the foundation, lined with fine grass; placed in low junipers or rhododendrons, on a ledge of rock, under an overhanging bank, on the ground against a boulder, or among the buttress roots of a gnarled tree. *Eggs*, 3 or 4, pale blue blotched with pale red-brown, similar to those of the European Blackbird but larger and rather more boldly marked. Average size of 2 eggs 33×23.4 mm (Baker).

MUSEUM DIAGNOSIS. Distinguished from *intermedius* by larger size and from peninsular subspecies by black plumage. Male often breed in brown female plumage. Young male. Upperparts, sides of head and neck, chin and throat blackish brown, tips of feathers on mantle blacker, a few ochraceous edges on chin and throat. Rest of underparts evenly barred ochraceous and blackish. Under tail-coverts black with ochraceous edges. Central streaks and edges of median and lesser coverts ochraceous. Wing and tail black. Lower back and rump sometimes barred with ochraceous.

Young female. Like young male but paler brown; greyish brown on rump and upper tail-coverts with paler tips. Mantle feathers with pale shaft-streaks. Wing and tail dark brown (HW).

Young of *maximus* are very variable but show considerably more difference in the sexes than in the nominate subspecies [cf. Witherby, 1938, 2: 140]. Difference between them and juveniles of *merula* very striking, owing to the much narrower shaft-streaks on the upperparts, which are also much paler and end in triangular-shaped marks at tip of feather. No shaft-streaks or markings on head and neck, while below they are less rufous and much darker on breast and throat. Some males have practically no shaft-streaks but the pale V-shaped mark at the tip of the feather is very pronounced (NBK).

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	144-161	25-29	c. 38	107-120 mm
♀♀	144-153	25-28		

(NBK, RM)

COLOURS OF BARE PARTS. Iris brown. Bill orange-yellow (♂), dull greenish yellow (♀). Legs and feet black (♂), dark brown (♀).

1753. Blackcapped Blackbird. *Turdus merula nigropileus* (Lafresnaye)

Merula nigropileus Lafresnaye, 1840, Rev. Zool.: 65 (Neilgherries, restricted to Kalhatti, northern Nilgiri Plateau by Ripley, 1950, JBNHS 49: 50)
Turdus simillimus maharattensis Whistler & Kinnear, 1932, Jour. Bombay nat. Hist. Soc. 36: 76 (Mahabaleshwar)
Baker, FBI No. 569, Vol. 2: 128
Plate 92, fig. 11

LOCAL NAMES. Kāstūri (Hindi); *Poda palisa* (Telugu); *Karimkili* (Malayalam).

SIZE. Myna ±; length c. 25 cm (10 in.).

FIELD CHARACTERS. Male dark greyish brown with a black cap; orange-yellow bill, eye-rim and legs.

Female more ashy above and paler generally, with the cap less distinct and brown.

THRUSHES AND CHATS

119

Young male has the upperparts, wings and tail dark sooty blue-grey much as in the adult; lesser and median coverts tipped with triangular fulvous spots. Underparts dark ashy olive, the feathers broadly edged with blackish; throat, central breast and abdomen with the centres of feathers largely white.

Young female has the upperparts dull olive-brown, the feathers faintly streaked with fulvous and edged with sooty. Wings, tail and underparts as in adult. Post-juvenal moult of body-feathers, lesser and median coverts.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	126-135	25-28	30-35	92-101 mm
♀♀	116-129		30-33	84-98 mm

(HW)

Weight 19 ♂♀ (Apr.-May) 60-94 (av. 74.9) g — SA.

COLOURS OF BARE PARTS. Iris brown; eye-rim orange; postorbital skin orange-brown, orange-yellow or rich orange corresponding with gape and bill. Gape and bill horny brown with orange patches at gape, nostrils and sides, or brownish orange with dusky tips, or bright orange with dusky tips; mouth orange-yellow. Legs, feet and claws dusky orange-yellow (SA).

1754. Eastern Ghats Blackbird. *Turdus merula spencei* Whistler & Kinnear

Turdus simillimus spencei Whistler & Kinnear, 1932, Jour. Bombay nat. Hist. Soc. 36: 77 (Jeypore Agency)
Not in Baker, FBI

LOCAL NAME. *Poda palisa* (Telugu).

SIZE. Myna ±; length c. 25 cm (10 in.).

FIELD CHARACTERS. As in 1753, q.v.

STATUS, DISTRIBUTION AND HABITAT. Common resident, subject to seasonal altitudinal and local movements. The Eastern Ghats complex from northern Orissa (c. 22°N.) south at least to the Seshachalam Hills (c. 14°N.). Affects sholas and wooded ravines from c. 750 m to the top of the hills.

GENERAL HABITS, FOOD AND VOICE. As in 1753.

BREEDING. Presumably as in 1753.

MUSEUM DIAGNOSIS. Upper plumage very similar to that of *simillimus* (1755) but paler and not so pure black on crown; lower plumage agrees with that of *nigropileus* (1753) except that 'the faint viscous flush of that bird is replaced by a cold grey tint' (Whistler & Kinnear).

Plate 92, fig. 12

LOCAL NAMES. *Karimkili* (Malayalam); *Karun kūruvi* (Tamil).

118

TURDINAE

STATUS, DISTRIBUTION AND HABITAT. Partial migrant, or resident subject to seasonal movements, chiefly altitudinal. Southern Rajasthan (Mt Abu) and eastern Gujarat (Panchmahals dist.) east in the western Vindhya Range and along the Satpuras at least to Seoni (c. 79°30'E.), and south along the Western Ghats at least to Belgaum. All recent records south of this locality are between November and March, the non-breeding season. (Cf. Salim Ali, 1969, *Birds of Kerala* p. 386, JBNHS 43: 330 and 38: 288; Koelz, JBNHS 43: 15. Most older records are undated including, apparently, the type specimen.) Breeds in the hills from c. 900 m up to the highest summits. Birds from the northernmost part of the range, and the greater part of the Madhya Pradesh population, are migratory, ranging in winter to the Gir Forest (Dharmakumarsinhji), Farahabad (c. 79°E., JBNHS 36: 385) and through the Western Ghats and hills of Kerala and western Tamil Nadu to the Cardamom Hills (JBNHS 36: 76), in the low country up to c. 1000 m. Affects moist-deciduous and evergreen forest, sholas, wooded ravines and broken country. In winter frequents well-shaded areas in plantations, gardens and forest.

MIGRATION. Where a summer (breeding) visitor, e.g. in the higher Western Ghats, arrives in April, departs in October-November. In winter spreads out a good deal in the low country and foothills moving locally with the ripening of various fruits and berries on which it feeds.

GENERAL HABITS. Keeps singly and in pairs in the breeding season; often in scattered pairs or small parties in winter. Feeds on the ground as well as in trees. Largely a terrestrial feeder, hopping about rummaging in the mulch and flicking aside dead leaves for insects and windfallen fruit in the typical thrush manner.

FOOD: Insects, snails, slugs, earthworms, fruit and berries (lantana, sandalwood, jamun, wild figs, etc.); also fond of flower-nectar (*Erythrina*, *Salmalia*, etc.).

VOICE AND CALLS. Has a melodious song, not unlike that of the Magpie-Robin (1661) but louder and richer, and freely interlarded with perfectly mimicked calls of many other birds, e.g. grey partridge, pied crested and plaintive cuckoos, pariah kite, wood shrike, tailor bird and others. Heard in the early morning and late afternoon till well after sunset in the breeding season. Silent during winter except for the throaty chuckles and shrill *kres*. Alarm-notes, a harsh *churr* and the characteristic throaty quick-repeated *chuck-chuck-chuck*; call-note, a subdued but high-pitched *kree-ee*, frequently uttered.

BREEDING. Season, June to August (monsoon). *Nest*, a bulky cup of moss, grass and roots with a layer of mud and an inner lining of rootlets and grass; placed in a fork of a small tree or bush between one and seven metres above the ground. *Eggs*, normally 3, sometimes 4 or 5, pale grey-blue to umber brown boldly blotched with reddish, usually more densely around the larger end. Average size of 50 eggs 27.4×20.9 mm (Baker). Both sexes share in nest-building and feeding young. Incubation by female (at least mainly); period undetermined.

MUSEUM DIAGNOSIS. Male has a black cap better defined than in other subspecies. Second primary (as.) longer than seventh. Postnuptial moult complete.

120

TURDINAE

SIZE. Myna ±; length c. 25 cm (10 in.).

FIELD CHARACTERS. As in 1753, q.v.

STATUS, DISTRIBUTION AND HABITAT. Common resident. The hills of south-western India from the Brahmagiris and the Biligirirangans south to the Nelliampathis and Palnis where intergrading with *bourdilloni*. Affects evergreen sholas, from c. 1200 m to the top of the hills, lower from October to March when also seen in coffee plantations.

GENERAL HABITS, FOOD AND VOICE. As in 1753.

BREEDING. Season, begins in March but is at its height after the onset of the rains; lasts till August. *Nest*, a substantial cup of moss, grass and lichen with an outer lining of mud and an inner one of grass, placed in evergreen shrubs or small trees, very often on ledges in banks. Normal clutch size 2, occasionally 3, sometimes up to 5. Average size of 50 eggs 29.3×21.3 mm (Baker).

MUSEUM DIAGNOSIS. See Key to the Subspecies.

Male: forehead, crown and nape black. Whole upper plumage, wings and tail dark slaty. Underparts paler, more ashy.

MEASUREMENTS AND COLOURS OF BARE PARTS. As in 1756.

1756. Bourdillon's Blackbird. *Turdus merula bourdilloni* (Seeböhm)

Merula bourdilloni Seeböhm, 1881, Cat. Bds. Brit. Mus. 5: 251
(Travancore = Calathoorpolay Patnas, Travancore)
Baker, FBI No. 568, Vol. 2: 127

LOCAL NAMES. *Karimkili* (Malayalam); *Karun kūruvi* (Tamil).

SIZE. Myna ±; length c. 25 cm (10 in.).

FIELD CHARACTERS. As in 1753, q.v.

STATUS, DISTRIBUTION AND HABITAT. Common resident. The hills of Kerala and western Tamil Nadu from the Nelliampathis and Palnis south to the Ashambu Hills. Affects evergreen sholas from c. 900 m up to the highest summits.

GENERAL HABITS. As in 1753.

FOOD. As in 1753. Also recorded: berries of *Maesa*, *Trema*, *Lantana*, and wild figs, and flower-nectar (*Salmalia*, *Erythrina*, etc.).

VOICE AND CALLS. As in 1753.

BREEDING. As in 1753. Average size of 20 eggs 27.6×20.5 mm (Baker).
MUSEUM DIAGNOSIS. See Key to the Subspecies. Differs from *simillimus* (1755) in being darker.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail

♀♀	119-122	26-28		93-98 mm

(SA)

COLOURS OF BARE PARTS. Iris dark brown; eye-rim orange-yellow. Bill, legs and feet orange-yellow.

THRUSHES AND CHATS

121

1757. Ceylon Blackbird. *Turdus merula kinnisii* (Kelaart)

Merula kinnisii Kelaart in Blyth, 1851, Jour. Asiat. Soc. Bengal 20: 177
(Newera Elia)

Baker, FBI No. 567, Vol. 2: 126

Plate 92, fig. 10

LOCAL NAMES. *Kalu kurullā* (Sinhala); *Kari-kūrūri* (Tamil).

SIZE. Myna ±; length c. 25 cm (10 in.).

FIELD CHARACTERS. A dark slaty thrush with orange bill, eye-rim and legs. Sexes alike.

On a casual glimpse may be confused with Black Bulbul, *Hyphantornis* *m. humii* (1150), but the latter's slimmer build together with markedly forked tail and coral-red bill and legs distinctive.

STATUS, DISTRIBUTION and HABITAT. Resident, subject to seasonal movements; plentiful but locally distributed. The hills of Sri Lanka above c. 900 m, becoming more common in the higher parts of its range. Affects forest and well-wooded tea estates and gardens.

GENERAL HABITS. As in 1753, q.v.

FOOD. Insects and berries, especially of *nillu* (*Strobilanthes*); also flower-nectar.

VOICE and CALLS. Song, a much reduced blackbird-like series of chuckles and whistles (SDR) usually delivered from the top of a tree. Other notes as in 1753.

BREEDING. Season, two periods, the first beginning second half of March, sometimes February, and lasting till May; the second between August and November. Nest and eggs (c/2, occasionally 3) as in 1753. Average size of 14 eggs 26.6 × 20.6 mm (Baker).

MUSEUM DIAGNOSIS. Plumage, including crown, entirely dark slaty. Female very similar but has the underparts slightly duller and more sullied with brown.

Differentiated from Indian races of *Turdus merula* by smaller size and the greater amount of slaty blue in the plumage.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	104-119	24-26	31-33	85-100 mm
♀♀	105-116		30-33	81-92 mm (HVV)

Weight 2 ♂♂ 66, 67 g (SDR).

COLOURS OF BARE PARTS. Iris brown. Bill ♂♀ orange-yellow. Legs and feet orange-yellow (♂), dull orange-yellow (♀).

Nepal: 81 (Nepal)

Baker, FBI No. 572, Vol. 2: 132

Plate 92, fig. 16

LOCAL NAMES. *Wān kāsūr* (Kashmir); *Lāl kāsūrā* (Hindi).

SIZE. Myna +; length c. 27 cm (11 in.).

FIELD CHARACTERS. Male. Above, head and neck creamy grey paling to whitish on nape; rest of upperparts chestnut. Wings and tail blackish. Below, throat and upper breast whitish; upper belly and flanks chestnut; centre of belly whitish, sometimes with dusky spots; under tail-coverts blackish with broad white shaft-streaks.

Female much duller: head darker and brownish; chestnut paler and margined below with pale greyish.

STATUS, DISTRIBUTION and HABITAT. Resident, subject to vertical movements, fairly common. The Himalayas from the Safed Koh, Murree and Ladakh east at least to Nepal Valley (Proud, 1955, JBNHS 53: 61; Rand

THRUSHES AND CHATS

123

& Fleming, 1957, *Feldiana*, Zool., 41(1): 162). Two records from Sikkim, January and May (Biswas, Stevens); none from Bhutan, Arunachal Pradesh or southeastern Tibet. Breeds between 2100 and 3000 m, locally down to 1500 m (Murree) or up to 3200 m (Garhwal). Winters (October to March) between 1200 and 2600 m, occasionally down to the foothills (Kohat); also recorded in winter from the Garo Hills (Godwin-Austen) and Cachar (Baker, sp.?). Affects forest, especially fir and horse-chestnut; more open country and orchards in winter.

GENERAL HABITS. Shy, quiet and unobtrusive. Keeps singly or in pairs in the breeding season, in small flocks thereafter, sometimes congregating in large flocks with *T. r. atrogularis*, *T. bouboul* and *T. albocinctus*.

FOOD. Insects and berries (of holly etc.). Also visits rhododendron blossoms for nectar (GD).

VOICE and CALLS. Song recalls Song Thrush's (*Turdus philomelos*) but is less sustained; rendered as *ye-bre, ye-bre, ye-bre—diddiyit, diddiyt, diddiyt—yip-bru, yip-bru* (Magrath); usually uttered from the top of a tree. 'A really fine songster, perhaps the best in the thrush family in India, not excepting *T. bouboul*' (BBO). Call-note, a blackbird-like chuckle.

BREEDING. Season, April to end of July. Nest, a cup of moss, twigs, roots and dead leaves lined with grass, rootlets or pine needles; a considerable quantity of mud is generally present immediately under the lining; the majority of nests placed between two and three metres above the ground in saplings, or resting against a tree-trunk in a tangle of outgrowing branches; many also built on rock ledges, in banks, or among the roots of a fallen tree, occasionally in holes in rocks or gnarled tree-trunks. Eggs, 2 to 4, more commonly 3, light green covered with reddish brown spots and blotches; similar to eggs of *T. merula* but more boldly blotched. Average size of 50 eggs 30.6 × 21.6 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters.

First-year males have browner wings, primary-coverts and tail.

Young (juvenile). Head and sides of neck ochraceous brown with faint paler centres. Rest of upperparts, lesser, median and greater coverts chestnut-brown with dark tips, faint paler centres on mantle and ochraceous streaks on coverts. Chin and throat cream edged with brown at the sides. Underparts brown with ochraceous centres and blackish tips (more marked in male than in female). Belly albescent. Postjuvénal moult of body-feathers, lesser, median and (?) greater coverts.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	135-144	(1) 30	33	110 mm
♀♀	132-135	—	—	— mm (BB, MD)

Weight 2 ♂♂ (October) 84.6, 99.7 g (RAP).

COLOURS OF BARE PARTS. Iris brown; eye-rim yellow. Bill yellow. Legs and feet dusky yellow.

TURDINAE

1759. Eastern Greyheaded Thrush. *Turdus rubrocanus gouldii* (Verreaux)

Merula Gouldii Verreaux, 1871, Nouv. Arch. Mus. Hist. Nat. Paris 6: 34

(Setchuan occidental = Paohing)

Baker, FBI No. 573, Vol. 2: 133

Plate 92, fig. 17

LOCAL NAME. *Chiama gunka* (Tibetan).

SIZE. Myna +; length c. 27 cm (11 in.).

FIELD CHARACTERS. As in 1758, q.v.

STATUS, DISTRIBUTION and HABITAT. Occasional or possibly regular winter visitor: common in the Burmese Naga hills. Has straggled to North Lakhimpur (once) and Nepal (once). Recorded in the Khasi and Cachar hills (Baker, sp.?).

Extralimital. Breeds in the mountains of western China and eastern Tibet. A winter visitor to southeastern Tibet and northern Burma.

GENERAL HABITS. As in 1758.

FOOD. Stomachs examined contained ants, beetles, grasshoppers, larvae and pupae, pond-snails, berries and seeds (Stanford).

VOICE and CALLS. As in 1758.

MUSEUM DIAGNOSIS. Differs from *rubrocanus* (1758) in being darker. Whole head dark smoke-grey; chestnut of back not so deep, more rusty; centre of belly less whitish.

MEASUREMENTS

	Wing	Tail
♂♀	137-148	104-106 mm (Baker)

1760. Kessler's Thrush. *Turdus kessleri* Przevalski

Turdus Kessleri Przevalski, 1876, Mongol. i Strana Tangut 2: 62, pl. x (Kansu)

Baker, FBI No. 575, Vol. 2: 134

Plate 92, fig. 15

LOCAL NAMES. None recorded.

SIZE. Myna +; length c. 27 cm (11 in.).

FIELD CHARACTERS. Male. A large, striking black-and-tan thrush with yellow bill. Above, head, nape and upper back black; scapulars rufous brown; centre of back whitish buff changing to rufous-brown on rump and upper tail-coverts. Wings and tail black. Below, throat and breast black. Upper belly whitish buff changing to chestnut on lower parts. Under tail-coverts black margined with chestnut.

Female. Above, head, nape, upper back, wings and tail dark brown; scapulars and back grey-brown, rump tinged with tawny. Below, throat, upper breast and sides of head dark brown, the ear-coverts with pale shaft-streaks. Rest of underparts grey-brown tinged with tawny on belly.

STATUS, DISTRIBUTION and HABITAT. A straggler or irregular winter visitor to the eastern Himalayas. One record: a party of four at Changu, 3700 m, Sikkim, 21 December (Meinertzhagen, *Ibis* 1927: 577). A specimen obtained by Mandelli in Tibet close to the Sikkim border, c. 2700 m, in November. Might occur in winter in northern Bhutan or northern Arunachal

THRUSHES AND CHATS

125

Pradesh. In winter affects low scrub, especially juniper, and cultivated fields.

Extralimital. Breeds in eastern Tibet and western China, in low rhododendron and willow scrub above timber-line between 3600 and 4500 m, mostly above 4000 m, in rocky country. In winter down to c. 2100 m.

GENERAL HABITS. Keeps in flocks in winter, often in company with *Turdus ruficollis* and *T. naumanni*. Pairing takes place in May but the birds do not entirely lose their sociable habits even during the breeding season. Flies low over the ground with ten to fifteen wing-strokes alternated with short glides.

FOOD. In winter chiefly juniper berries (Schäfer).

VOICE AND CALLS. Alarm-note, a loud, harsh chuckle similar to that of *T. albocinctus*; call-note, a soft *dug dug*. Song rarely heard, composed of short phrases reminiscent of *T. viscivorus* (Schäfer).

BREEDING. Extralimital.

MUSEUM DIAGNOSIS. See Field Characters.

Young. Above. Crown and upper back dark brown with pale shaft-streaks; scapulars, back and rump whitish barred with dark brown; wing-coverts tipped with whitish, the lesser and median with pale shaft-streaks. Wings and tail dark brown. Below. Throat and breast whitish buff heavily spotted with dark brown; belly buff barred with dark brown; under tail-coverts dark brown edged with buff.

MEASUREMENTS

Plate 92, fig. 14

LOCAL NAME. *Daokat jadi* (Cachari).

SIZE. Myna ±; length c. 23 cm (9 in.).

FIELD CHARACTERS. Male. Above, russet brown. A narrow white supercilium. Lores black, a white spot under the eye. Below, throat, sides of head and upper breast grey more or less suffused with a rusty hue; rest of underparts white, under tail-coverts with broad grey-brown margins.

Female. Above, like male. Below, chin and throat white speckled with brown, and grey of male replaced by fulvous grey.

THRUSHES AND CHATS

127

does not venture into open country, as a rule keeping to forest. Feeds mostly on the ground—also on berry-laden shrubs—in the mornings and evenings, resting in shady trees during the day.

FOOD. Insects and larvae, snails, berries and vegetable matter.

VOICE AND CALLS. Soft pleasant notes, very like Blackthroated Thrush's (1763), uttered while feeding. When approached, the birds fly swiftly up into a nearby tree with a whirr of wings, uttering a thin, pipit-like zip-zip.

BREEDING. Extralimital.

MUSEUM DIAGNOSIS. See Field Characters.

Young (immature). Upperparts, lesser and median coverts much as in adult, but all feathers with ochraceous central streaks, most marked on mantle and scapulars which have darker tips; ear-coverts ochraceous with dark tips. Rest of wings, and tail, much as adult. Underparts white, suffused with fulvous on breast and flanks, all feathers, except on belly and under tail-coverts, with dark brown ends, heaviest on breast. Postjuvénal moult of body, lesser, median and part of greater coverts (Whistler, MSS.).

MEASUREMENTS

FIELD CHARACTERS. Male. Above, grey-brown slightly spotted with dark brown on crown and nape. Lores and a short supercilium black. Ear-coverts grey-brown, sides of neck black. Below, throat and breast black (in winter with whitish fringes). Rest of underparts white.

Female. Above, brown. Below, throat streaked dark brown and whitish. A broad breast-band blackish with whitish fringes. Rest of underparts white, upper belly and sides with a few pale brown streaks.

126

TURDINAE

STATUS, DISTRIBUTION and HABITAT. Winter visitor, 'not rare' in Nagaland and Manipur eastern hills (Hume, Codwin-Austen). Also recorded in Shillong and Cherrapunji (Godwin-Austen) and probably North Cachar (Baker, JBNHS 9: 137). Frequents the hills above c. 1500 m. **Extralimital.** Breeds in China (Hophe, north of Peking); winters in Burma.

MIGRATION. Arrives in winter quarters at the end of October (first date 21 Oct.); remains until early April.

GENERAL HABITS. In winter keeps in flocks, often in company with *T. obscurus*.

FOOD. Insects and berries.

VOICE AND CALLS. Unrecorded.

BREEDING. Extralimital.

MUSEUM DIAGNOSIS. See Field Characters.

MEASUREMENTS

	Wing	Bill (from gape)	Tarsus	Tail
1 ♂	127	25	33	94 mm
2 ♀♀	119, 121	24, 25	30	89, 91 mm
				(Hume)

COLOURS OF BARE PARTS. Iris brown. Bill blackish brown, yellow-brown at gape and on base of lower mandible. Legs and feet brownish yellow.

1762. **Dark Thrush.** *Turdus obscurus* Gmelin

Turdus obscurus Gmelin, 1789, Syst. Nat. 1: 816 (Siberia = Lake Baikal)
Merula subobscurus Salvadori, 1889, Ann. Mus. Civ. Genova (2) 7: 413 (Karen Hills)
Baker, FBI Nos. 581 and 582, Vol. 2: 141, 142

Plate 93, fig. 11

LOCAL NAME. *Daokat gashim* (Cachari).

SIZE. Myna ±; length c. 23 cm (9 in.).

FIELD CHARACTERS. Male. Above, olive-brown, greyer on nape and sides of head. A broad white supercilium. Lores black. A white spot under the eye. Below, chin white, throat slaty grey. Breast and flanks pale fulvous brown or clay colour. Belly white; under tail-coverts white, edged brown at base.

Female. Like male but throat white streaked with brown. Ear-coverts paler, streaked with white.

STATUS, DISTRIBUTION and HABITAT. Common winter visitor to Meghalaya, Nagaland, Manipur and Mizoram; also most parts of Bangladesh *sic* Rashid. Recorded also in the Arunachal foothills (Stevens) and Sikkim (once, Mandelli). Has straggled to Belgaum (March), Nepal c. 2300 m (18 May), and South Andaman Island (March). Affects open forest.

Extralimital. Breeds in Siberia from the Yenisey to Kamchatka and Japan. Winters in Taiwan, southern China and the Indochinese countries.

MIGRATION. Arrives in winter quarters in October (earliest date 15), remains until April (latest date 30).

GENERAL HABITS. In winter keeps in flocks of considerable size, sometimes in company with *T. r. ruficollis* and *T. r. atrogularis*, but unlike them

TURDINAE

Turdus ruficollis atrogularis

■ Main winter range ... Extreme winter extension

STATUS, DISTRIBUTION and HABITAT. Abundant winter visitor.¹ Pakistan from N.W.F.P. through Baluchistan to the Makran Coast, and Sind; the Himalayas and adjacent plains from the Indus Valley and Gilgit eastward through Nepal, Sikkim, Bhutan and Arunachal Pradesh; Nagaland, Manipur, Assam and Bangladesh. In the Himalayas generally found up to c. 3000 m, in Nepal to 3800 m and in Sikkim up to 4200 m. Extension into the plains governed by weather conditions. May occur fairly often south to Jhang, Ludhiana, Bharatpur (Rajasthan — SA) and Gorakhpur. Has been recorded as far south as lat. c. 21°N. (Nasirabad, Sehore, Raipur and Sambalpur); once in Kutch (Jakhau, SA). Affects cultivation, grassy slopes, edges of forest, sparsely scrubbed fallow land, stubble fields and pastures.

Extralimital. Breeds in eastern Russia and eastward through the Siberian taiga to the Yenisey. For details see Vaurie, 1959, 2: 396-7.

MIGRATION. Arrives mostly in October (earliest date 9 September) at high elevations, descending as the weather gets colder to the lower valleys and plains where it is most plentiful between January and March. Apparently arrives in the central Himalayas from either or both the west and east as it reaches Nepal rather late in November or December. Numbers vary greatly from year to year and from month to month, depending on weather conditions and food supply. Northward migration takes place in March-April, a few birds remaining until the end of April or even early May. Southward migration from breeding grounds is apparently very

¹ Alleged breeding in Murree hills and Sikkim has not been substantiated by Whistler's investigations.

THRUSHES AND CHATS

129

leisurely whereas spring migration seems to take place hurriedly (cf. Diesselhorst, 1968).

GENERAL HABITS. A highly gregarious species usually seen in loose flocks of 3 to 30 individuals, or up to 50 before their spring departure. Progresses on the ground in long hops when feeding, flying up into high trees when disturbed. Also picks berries on bushes and trees. Roosts in company in dense-foliaged trees. Consorts freely with other thrushes in large flocks.

FOOD. Insects — grasshoppers, beetles, caterpillars and grubs, white ants, etc.; also earthworms, snails, fruit and berries (*bet* drupes — *Zizyphus*, scarlet berries of a *Magnolia*, and hips and haws recorded), and flower-nectar.

VOICE AND CALLS. Call-note similar to that of the Song Thrush or Redwing (a thin *seet*). Alarm, chuckle like that of a Blackbird but much softer; a throaty *whick-whick-whick* (SA).

BREEDING. Extralimital. However, specimens (♂ ♀) collected in Nepal between 20 March and 17 April had mature gonads (Biswas, JBNHS 58: 677).

MUSEUM DIAGNOSIS. See Field Characters.

First-winter male like adult but black replaced by dark brown with white bases and longer white fringes giving a mottled appearance. There is much variation, some birds having the centre of chin and throat more or less white streaked with brown and being indistinguishable from female. Outer greater coverts with small pale tips to outer web (Whistler, MSS.).

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	127-143	22-25	32-35	89-104 mm
♀♀	125-138			

(wing by Dementiev, rest BB, SA)

Weight 8 ♂♂ (Oct.-April) 71.1-94.2; 6 ♀♀ (Oct.-April) 72-96 g (RAP, Paludan). 21 ♂♂ (Nov.-Mar.) 57-94 (av. 77.1) g — SA.

COLOURS OF BARE PARTS. Iris dark brown. Bill: upper mandible dark horny with yellow on gape and sides; lower mandible yellow with dark horny tip. Legs yellowish- or brownish grey with dusky front, or yellowish grey to horny brown; claws dark horny; soles white.

1764. Redthroated Thrush. *Turdus ruficollis ruficollis* Pallas

Turdus ruficollis Pallas, 1776, Reise Russ. Reichs 3: 694 (Dauria)

Baker, FBI No. 577, Vol. 2: 136

Plate 93, fig. 12

LOCAL NAME. *Daokat gejae* (Cachari). See also 1763.

SIZE. Myna ±; length c. 25 cm (10 in.).

FIELD CHARACTERS. Male. As in 1763 but black of throat and supercilium replaced by chestnut, and tail rufous except central rectrices. In winter the chestnut feathers are fringed with whitish.

Female as male but chestnut paler and much mottled with white and more or less heavily spotted with black. Very variable. Some have throat and breast cream with a rusty tinge and no spots on breast; others have

THRUSHES AND CHATS

131

Female. Above, crown, ear-coverts and back grey-brown becoming more rufous-brown on rump. Wing rufous as in male. Throat and sides of neck pale cream speckled with dark brown, especially on the sides. Breast and flanks whitish with scale-like chestnut markings. Centre of belly white.

STATUS, DISTRIBUTION AND HABITAT. Irregular winter visitor, rare in the western Himalayas, more frequent in Assam. Recorded from Kohat (once in April — *Ibis* 1909: 222), Lahore, 12 January (J. R. S. Holmes *vide* T. J. Roberts pers. comm.), central Nepal (large flocks in winter and spring — Proud, JBNHS 48: 703), the Dafia Hills, Dibrugarh, Barail Range and Khasi Hills (SF 11: 130) and North Cachar (JBNHS 9: 136). Recorded between 900 and 3000 m. Affects open fields and grasslands, and thinly wooded country.

Extralimital. Breeds in Siberia from the Yenisey river to Kamchatka. Winters in southeastern Asia from Japan and Hopen south to Taiwan, northern Burma and Yunnan.

MIGRATION. Appears to arrive rather late in autumn (earliest 14 November) or even in mid-winter. Last date 18 April.

GENERAL HABITS. In winter usually keeps in flocks. Feeds mostly on the ground.

FOOD. Insects, snails, berries.

VOICE AND CALLS. Alarm-note a rapid *kereg*. Call-note, a starling-like *spirr*. Also *tack-tack-tack* when going to roost.

BREEDING. Extralimital.

MUSEUM DIAGNOSIS. See Field Characters.

MEASUREMENTS

Bill (from skull) 24-25; tarsus 32-33 mm (MD)

Weight 3 ♂♂ 78-106; 2 ♀♀ 87, 88 g (Dementiev).

COLOURS OF BARE PARTS. Iris brown. Bill blackish brown, yellow at base of lower mandible. Legs and feet brown.

1766. Fieldfare. *Turdus pilaris* Linnaeus

Turdus pilaris Linnaeus, 1758, Syst. Nat., ed. 10, 1: 168 (Europa = Sweden)

Baker, FBI No. 593, Vol. 2: 155

Plate 93, fig. 15

LOCAL NAMES. None recorded.

SIZE. Myna +; length c. 27 cm (11 in.).

FIELD CHARACTERS. Above, head, nape and ear-coverts grey; a few black streaks on crown. Back smoky brown; rump grey. Tail dark brown. Below, throat and breast rusty buff with dark brown streaks. Flanks squamated with dark brown. Centre of belly whitish. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Accidental. One record (undated) from Saharanpur, U.P. (an error in the locality is however not to be excluded). Affects open fields and orchards.

130

TURDINAE

pectoral spots and a rusty tinge throughout; all have a moustachial line of dark brown spots.

The rufous outer rectrices distinguish both sexes from all other members of the genus, including the Blackthroated Thrush.

STATUS, DISTRIBUTION AND HABITAT. Winter visitor to the Himalayas from N.W.F.P. eastward through Nepal (specimens in British Mus.; also Fleming & Traylor, 1964: 547), Sikkim, Bhutan and Arunachal Pradesh; the plains of the Brahmaputra, the Garo and Khasi hills, Bangladesh, Nagaland and Manipur. Common in the east, occasional west of Sikkim. Habitat as in 1763.

Extralimital. Breeds in Siberia in the Lake Baikal region, intergrading with *atroregularis* in the Altai and Sayan Mts. Winters east through south-eastern Tibet, Burma and northern Yunnan.

MIGRATION. As in 1763.

GENERAL HABITS, FOOD AND VOICE. As in Blackthroated Thrush (1763) with which it often consorts, associating freely also with *T. unicolor*, *T. obscurus* and other thrushes in large flocks.

BREEDING. Extralimital.

MUSEUM DIAGNOSIS. See Field Characters. Intermediates between this form and *atroregularis* occur, apparently more often in the western Himalayas (cf. Meinertzhagen, *Ibis* 1927: 576).

LOCAL NAMES. None recorded.

SIZE. Myna ±; length c. 22 cm (8½ in.).

FIELD CHARACTERS. Above, entirely olive-brown; a conspicuous buff supercilium. Below, creamy white streaked with dark brown on throat, with paler brown on breast and upper belly. Flanks, under wing-coverts and axillaries rich rufous. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Irregular winter visitor? Sight records only in Kohat and near Drosh where a bird has been collected for identification (Jerdon, *Birds of India* 1: 532; Perreau, JBNHS 19: 911; Wall, F., *ibid.* 21: 617). Affects open forest and fields.

Extralimital. Breeds in northern Europe and Siberia from Iceland east to the Kolyma river. Winters in western Europe, the Mediterranean countries and the Middle East.

GENERAL HABITS. Those of the genus. Feeds mostly on the ground, flying into trees when disturbed.

FOOD. Insects and berries.

VOICE AND CALLS. The only note likely to be heard in winter is a thin *tut-tut*.

BREEDING. Extralimital.

MUSEUM DIAGNOSIS. See Field Characters.

¹ *Turdus rufinus* Linnaeus has been placed on the Official Index of Rejected and Invalid Names (ICZN 20: 199-210, 1959).

THRUSHES AND CHATS

133

MEASUREMENTS

	Wing	Tail
♂♂	112-124	
♀♀	108-116	c. 80 mm

(Dementiev)

Bill (from skull) c. 24 mm; tarsus c. 30 mm (MD)

Weight 7 ♂♂ 52-65 (av. 59.4); 5 ♀♀ 58.5-72.9 (av. 63.2) g (Dementiev).

COLOURS OF BARE PARTS. Iris brown. Bill: upper mandible dark brown, lower mandible dark at tip, fleshy horny at base. Legs and feet fleshy grey-brown.

1768. *Missel Thrush*. *Turdus viscivorus bonapartei* Cabanis*T. (urdus) Bonapartei* Cabanis, 1860, Jour. f. Orn. 8: 183 (Himalayas)
Baker, FBI No. 592, Vol. 2: 154

Plate 93, fig. 16

LOCAL NAME. *Techal kástür* (Kashmir).

SIZE. Myna +; length c. 28 cm (12 in.).

FIELD CHARACTERS. -A large grey-brown thrush with holdly spotted underparts. White under wing-coverts conspicuous in flight. Above, grey-brown, flight-feathers more or less edged with white. A pale eye-ring.

x c. 1

Rectrices, especially outer ones, tipped with white. Below, buff boldly marked with roundish dark brown spots. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Common resident, subject to vertical movements. Pakistan in northern Baluchistan, N.W.F.P., Chitral, Gilgit and eastward along the Himalayas to western Nepal (Fleming & Traylor, 1968). Breeds mostly between 2400 and 3600 m, locally up to 3900 m (Chitral, Lahul) or down to 1800 m (Kashmir, Simla). Winters down to c. 1200 m, occasionally reaching the foothills and adjacent plains (Quetta, Punjab Salt Range, Lahore); also observed at 3300 m at end of November. Affects open forest of fir, deodar, juniper, and pine, sometimes mixed with oak or birch; also dwarf juniper forest above timber-line. In winter also open grassy hillsides, edges of forest and hill cultivation.

EXTRALIMITAL. Extends to Afghanistan and north through Turkestan to the Sayans and the Angara river. The species ranges west to Sweden, the British Isles and Morocco.

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 9 cm (3½ in.).

FIELD CHARACTERS. As in 1770, q.v.

STATUS, DISTRIBUTION and HABITAT. Resident, fairly common but local. The Safed Koh between 2500 and 3700 m (Whitehead, *Ibis* 1909: 117).*Troglodytes troglodytes*

1. Distributional ranges 2. *magrathi* (1769) 3. *neglectus* (1770)
4. *nipalensis* (1771) 5. Extralimital races

Birds from Ziarat, northern Baluchistan (Christison, A. F. P., JBNHS 43: 481) presumably belong to this subspecies. Affects juniper scrub.

GENERAL HABITS, FOOD and VOICE. As in 1770.

BREEDING. Unrecorded; probably as in 1770.

MUSEUM DIAGNOSIS. Differs from *neglectus* (1770) in being almost uniform in colouring above, the barring being scarcely perceptible, and in having the throat

134

TROGLODYTIDAE

GENERAL HABITS. Keeps singly or in pairs during the breeding season, congregating after the middle of August, flocks of twenty or more then being commonly seen. Moves on the ground in long hops in search of food, flying up into trees when disturbed.

FOOD. Insects and larvae, berries. In Europe this species is the principal disseminating agent of the mistletoe berries.

VOICE and CALLS. Has a loud song given in rapid phrases of 5 or 6 notes, generally uttered from the tops of tall trees. Alarm-note, a characteristic rattle, sounding like a splinter of wood drawn over a comb — or harsh *kir-kir-kir* — *kir* reminiscent of Wood Shrike's (*Tephrodornis*). A subdued *krrr* while flying off.

BREEDING. Season, April to July. Nest, a solid cup of coarse twigs well covered with lichen and moss with a certain amount of clay in the foundation, lined with fine grass and rootlets; placed in saplings or junipers usually close to the trunk, sometimes in the lower branches of trees, between two and five metres above the ground. Eggs 3 to 5, normally 4, pale greenish grey marked over the whole surface with small reddish brown blotches, usually more numerous towards the larger end. Average size of 50 eggs 31.3 × 22.4 mm (Baker); 3 eggs 33.5 × 23.3 mm (HW); 3 eggs 34.5 × 21.8 (BBO). Building of nest and incubation by both sexes; incubation period 14 or 15 days.

MUSEUM DIAGNOSIS. See Field Characters.

Young. Above, general colour browner than adult, each feather with a pale ochraceous centre, small on head, narrow on rump and large on rest of upperparts, all with dark brown fringes. Lesser, median and inner greater coverts with large central ochraceous streaks. Below, as adult but spots smaller. Postjuvinal moult of body-feathers, lesser, median and inner greater coverts.

Weight 2 ♂♂ (April, July) 107, 125; 3 ♀♀ (April, June) 100-118 g (Paludan).

COLOURS OF BARE PARTS. Iris dark brown. Bill dark brown or yellowish. Legs and feet olive-brown or light yellowish brown; claws blackish to olive-yellow.

Family TROGLODYTIDAE: Wrens

For description see Baker, E. C. S., 1922, FBI 1: 444; Van Tyne, J. & Berger, A. J., 1959: 521; Armstrong, E. A., 1964, article 'Wren' in Thomson, A. L. (ed.), *A New Dictionary of Birds*, London & New York.

Genus TROGLODYTES Vieillot

Troglodytes Vieillot, 1807, Hist. Nat. Ois. Amér. 2: 52. Type, by subsequent designation, *Troglodytes aedon* Vieillot

Bill slender and weak, about half the length of the head. Wing very short and rounded, first primary (as.) about two-thirds the length of second. Tail shorter than wing, of 12 rectrices, slightly graduated. Tarsus and claws long and slender.

136

TROGLODYTIDAE

ashy grey' (Whitehead). 'A densely banded race, the banding extending upward over the mantle and over the breast, grey-brown above, greyish below with a pale throat, not rufous nor smoky' (Vaurie).

MEASUREMENTS and COLOURS OF BARE PARTS. Unrecorded.

1770. *Kashmir Wren*. *Troglodytes troglodytes neglectus* Brooks*Troglodytes neglectus* Brooks, 1872, Jour. Asiat. Soc. Bengal 41: 328 (Kashmir)
Baker, FBI No. 460, Vol. 1: 446

Plate 75, fig. 1

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 9 cm (3½ in.).

FIELD CHARACTERS. A diminutive, dark rufous-brown bird with short, erect tail. Above, rufous-brown narrowly barred with dark brown on wings, lower back and tail. A pale eye-ring. Below, paler, somewhat whitish on belly and even more closely barred. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Common resident, subject to vertical movements. The western Himalayas from N.W.F.P., Balistan and Ladakh east to Garhwal. Breeds between 2700 and 3900 m, locally down to c. 2400 m (Kashmir). Winters (October to March) from c. 1200 (occasionally), up to at least 3000 m. Affects forest of fir, birch or oak, stunted growth on boulder-strewn ground, rocky nullahs and glacier moraines above timber-line. Partial to piled-stone parapet walls around upland cultivation and shepherds' encampments. In drier areas keeps generally to the proximity of streams.

EXTRALIMITAL. The species, in numerous geographical races, ranges west to Iceland and Morocco, and east through China to southeastern Siberia, the Aleutian Islands, Alaska and most of temperate North America.

GENERAL HABITS. Solitary and intensely restless. Hops about lightly in low scrub and amongst boulders, creeping in little jerks and starts in and out of crevices and brushwood in search of food, tail always cocked upwards. When disturbed bobs up and down ('curtseys') nervously like a dipper, with wings partly drooped, turning this way and that before vanishing into concealment.

FOOD. Insects.

VOICE and CALLS. Alarm-notes *tzick-tzick-tzick*, and a harsh scolding *te-tze-tze-tze*. Song, a cheery high-pitched, rapid and vibrant jumble of notes, somewhat reminiscent of that of *Phylloscopus colaptes* (1696) and astonishingly loud for so small a bird; uttered from inside cover or from an exposed situation; given regularly till mid July, resumed about September (probably), and freely uttered all winter often in the bleakest surroundings.

BREEDING. Season, May to July. Nest, a large, globular structure with lateral entrance-hole, of moss, lichen, juniper bark strips, grass or deer leaves, depending on locality, lined with rootlets, fine bast fibers, hair or feathers; placed among the roots of upturned trees, between boulders, in cracks in standing or fallen tree-trunks, in hollows in banks or sometimes in the roof of a derelict stone hut. When placed deep in holes, the dome is usually dispensed with, the nest being merely a loose collection of gran and

WRENS

137

feathers filling the back of the cavity; the height varies from ground level up to nine metres or so, most nests being within two metres of the ground. Eggs, 4 or 5, sometimes 3 or 6, white with pale rusty red specks, occasionally immaculate. Average size of 60 eggs 16.8 × 12.3 mm (Baker); of 35 eggs 17 × 12.5 mm (BBO).

MUSEUM DIAGNOSIS. Heavily and densely banded but much darker than *magrathii* (1769), smoky brown, including the throat; paler than *nipalensis* (1771). Young like adult but darker on throat; barring of underparts coarser.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	47-51	c. 11	19-20	26-30 mm (Baker)

Weight 1 ♂ (March) 8 g (Paludan).

COLOURS OF BARE PARTS. Iris dark brown. Bill: upper mandible dark brown, lower light brown. Legs and feet dark brownish flesh.

LOCAL NAME. *Mardek-pho* (Lepcha).

SIZE. Sparrow —; length c. 9 cm (3½ in.).

x c. 1

FIELD CHARACTERS. As in 1770, q.v.

STATUS, DISTRIBUTION AND HABITAT. Common resident, subject to vertical movements. The Himalayas from Tehri Garhwal eastward through Arunachal Pradesh. Breeds between 3300 and 3900 m (Garhwal), 3000 and 5000 m (Nepal) and up to 5500 m in adjacent parts of southern Tibet; between 2700 and at least 4700 m in Sikkim, Bhutan and Arunachal. Common in winter about 3600 m and observed up to 4700 m; occasionally descends as low as 2200 m. Affects rocks and boulders in fir, birch and rhododendron forest near timber-line, juniper and rhododendron scrub above timber-line, and boulder-strewn slopes, screes and moraines above the dwarf scrub zone. Almost entirely absent in the undergrowth in forest such as its European representative commonly patronizes. Here it is replaced by *Procygna albiventer* (1198), a species with very similar habits. The Nepal Wren affects chiefly rocks and boulders which offer a maze of crevices and holes, among which it loves to creep in and out. Where *Procygna* does not occur, however, the Wren may inhabit undergrowth in subalpine conifer forest. In winter also frequents piled-up stone walls in fields and villages, banks and rocky beds of streams, fallen tree-trunks in pine forest, and occasionally deep forest as well as open stony ridges.

DIPPERS

CINCLIDAE

1773. Whitebreasted Dipper. *Cinclus cinclus cashmeriensis* Gould

Cinclus cashmeriensis Gould, 1860, Proc. Zool. Soc. London: 494 (Kashmir)

Baker, FBI No. 477 (part), Vol. 2: 2

Plate 67, fig. 13

LOCAL NAMES. *Dungal*, *Galkar* (Kashmir).

SIZE. Myna ±; length c. 20 cm (8 in.).

FIELD CHARACTERS. A dumpy, stub-tailed, thrush-like bird of swift Himalayan streams. Above, head and upper back chocolate-brown. Rest of upperparts slaty with scaly brown markings on back and rump. Below, throat and breast white. Belly chocolate-brown with faint white tips to the feathers. Sexes alike.

Colour scheme provides perfect camouflage against background of rocks and rushing water, both at rest and in flight.

STATUS, DISTRIBUTION AND HABITAT. Common resident north of the main range, scarce on the southern aspect. The Himalayas from the Kagan Valley, Gilgit, Ladakh and Himachal Pradesh eastward to Sikkim. Recorded only from Langtang Khola, c. 3500 m in Nepal (Polunin, JBNHS 52: 895) where *Cinclus pallasi* (1775) ascends to nearly 5000 m; it is however common in adjacent Tibet (Mt Everest region, *Ibis* 1922: 506). Breeds between 3000 and 4800 m and up to 5100 m in southern Tibet, and possibly at lower elevations in Kashmir exceptionally: a specimen collected at c. 2000 m near Gund, Sind Valley on 6 April (Meinertzhagen) and eggs said by Baker (*Nidification* 1: 437) to have been obtained by A. E. Ward 'close to Srinagar, 1500 m' on 5 April, but doubtfully authentic (*vide* HW). Some birds drift downwards in winter but rarely below 2400 m. Affects swift-flowing streams and torrents, chiefly in the Tibetan facies; also glacial lakes and tarns even though partially frozen. Prefers smaller streams than *C. pallasi*, which it replaces at higher elevations; however the two species may occasionally be seen on the same watercourses where their altitudinal ranges overlap.

Extralimital. Adjacent parts of southern Tibet. The species ranges in the mountains of the Middle East, Morocco, Europe, the Ural Mts., central Asia (*leucogaster*, 1772) and western China.

GENERAL HABITS. Solitary or in widely separated pairs according to the season. Very territorial. Feeds mostly by plunging from a rock amid a stream into the icy water, swimming against the swift current with the help of its wings and walking on the bottom, remaining submerged for a half-minute or more. On emerging floats like a bobbing cork on the surface, sometimes whirled round like a coracle by the rushing current. Jumps on to a stone, shakes off the water from its plumage and resumes its nervous bowing and curviseing — partly flexing and stretching its legs, jerkily turning its head from side to side and cocking its stub tail. Flight direct and swift, with rapid quivering wing-beats low over water, following bends of streams or coasting between the larger boulders, only making a detour overland to avoid an intruder. On alighting usually dips in water close to a boulder and swims up to it. A bird has been observed feeding in a hole in the snow under which a stream flowed.

Display. '... The male nearby stood with its head pointing straight upwards so as to show the white throat and breast to their full extent. He

DIPPERS

141

stood high on his legs with them rather apart, and the tail was partly spread and pointed downwards. Both wings were stretched out and whirled rapidly. Thus he faced his mate, and as she moved about he moved so as to present the white patch continually towards her. Occasionally he varied the display by turning the axis of his body parallel to the ground, still with the wings whirring' (Whistler, MS.).

FOOD. Chiefly aquatic insects and their larvae.

VOICE AND CALLS. A shrill *dzhit*, *dzhit* uttered in flight. Has a wren-like high-pitched, piercing and lively song in the breeding season, often given also on cold but sunny winter days.

BREEDING. Season, April to July. Nest, a large globular structure usually made of moss, lined with fine grass or dead leaves and looking like a natural accumulation of flotsam debris; placed in banks overhanging water, in crevices of rocks or among a pile of rocks forming an islet amidst rushing water. Eggs, 4 or 5, long pointed ovals, pure white. Average size of 50 eggs 25.9 × 18.5 mm (Baker); of 8 eggs 26.1 × 18.8 mm (BBO).

MUSEUM DIAGNOSIS. See Key to the Subspecies. A rare colour phase occurs in which the throat and breast are entirely brown ('sordidus') [two records from Ladakh; more common in southeastern Tibet].

Young. Above, slaty with dark brown tips to feathers. All flight-feathers and rectrices tipped with white. Below, whitish, the feathers finely tipped with grey. Postjuvinal moult of body-feathers, lesser, median and inner greater coverts.

MEASUREMENTS

	Wing	Tarsus	Tail
♂ ♀	90-100	27-29	48-56 mm (Baker)

Bill from skull 3 ♂♂ 3 ♀♀ 22 mm (MD)

COLOURS OF BARE PARTS. Iris pale brown. Bill dark brown to blackish brown. Legs leaden in front, dark brown behind; toes leaden, soles pale greyish (Abbott). Gape of nestling lemon- to sulphur-yellow (SA).

1774. Eastern Whitebreasted Dipper. *Cinclus cinclus przewalskii* Bianchi

Cinclus przewalskii Bianchi, 1905, Bull. Brit. Orn. Cl. 15: 91

(Den-chu, basin of the Yangtse-kiang)

Cinclus cinclus beicki Meise, 1928, Orn. Monatsb. 36: 138

(Desen-laka, South Tating Range)

Baker, FBI No. 477 (part), Vol. 2: 2

LOCAL NAME. Daodui-di (Cachari).

SIZE. Myna ±; length c. 20 cm (8 in.).

FIELD CHARACTERS. As in 1773, q.v.

STATUS, DISTRIBUTION AND HABITAT. Common resident. N. Bhutan, southeastern Tibet and presumably Arunachal Pradesh (recorded at Lo La and Bimbi La on the border) in Tibetan facies. Breeds above c. 3600 m, up to 4700 m. Winters down to c. 2000 m in Tibet, 2700 m in Bhutan. Habitat as in 1773.

Extralimital. The mountains of western China and eastern Tibet north to Kansu.

DIPPERS

143

Cinclus pallasi

Distributional ranges

▨ *tenuirostris* (1775) • *dorjei* (1776) ■ *pallasi* (RE)

Display. Very similar to that of *C. cinclus* (1773). 'A dipper was standing on a rock, preening its plumage when its mate arrived. The first bird immediately stretched itself high on its legs, with the tail pointing straight downwards, and the head and neck extended to their full length with the beak pointing to the sky; it stood thus for some time with the wings whirring rapidly' (HW, JBNHS 31: 464).

FOOD. Aquatic insects and larvae.

VOICE AND CALLS. A shrill, harsh *dzit-dzit* less shrill than that of *C. cinclus* (Schäfer). 'A full, rich though short song'; somewhat more pleasant than that of the whitebreasted species (Schäfer).

BREEDING. Season, December to early August according to altitude. Nest, a massive globular structure of green moss and dry grass lined with dry leaves and moss roots; placed in clefts of moss- or fern-covered rocks, on a ledge of cliff or among boulders — sometimes in a hole in a fallen log or in a hollow in the masonry of a bridge — usually within a metre from water. Occasionally behind a waterfall or cascade, the birds having to fly through a curtain of water to reach the nest. When built in holes, the structure may or may not be domed. Eggs 4 or 5, white. Average size of 30 eggs 26.7 × 18.9 mm (Baker). Sometimes brood-parasitized by *Cuculus* sp. (JBNHS 64: 561).

MUSEUM DIAGNOSIS. See Key to the Subspecies. One complete annual moult, June to September.

Young. Above, grey-brown with numerous whitish spots. All remiges and wing-coverts margined with white. Thin tip of rectrices white. Below, all feathers whitish tipped with brown giving the bird a very mottled appearance. Postjuvinal moult of body-feathers, lesser, median and greater coverts.

142

CINCLIDAE

GENERAL HABITS, FOOD AND VOICE. As in 1773.

BREEDING. As in 1773.

MUSEUM DIAGNOSIS. See Key to the Subspecies. The dark-breasted colour phase ('sordidus') seems to be common in Tibet (Ludlow, *Ibis* 1937: 262).

MEASUREMENTS

1775. West Himalayan Brown Dipper. *Cinclus pallasi tenuirostris* Bonaparte

Cinclus tenuirostris 'Gould' = Bonaparte, 1850, Cons. Gen. Av. 1: 252 (central Asia, restricted to the Himalayas, Simla-Almora area, by Ripley, 1961, Synopsis: 540)

Baker, FBI No. 479, Vol. 2: 4

Plate 67, fig. 14

LOCAL NAMES. Dungal, Galkar (Kashmir); Nambong-karrink (Lepcha).

SIZE. Myna ±; length c. 20 cm (8 in.).

FIELD CHARACTERS. A squat, stub-tailed chocolate-brown thrush-like bird of clear rocky mountain streams, with a conspicuous white eye-ring. Sexes alike. STATUS, DISTRIBUTION AND HABITAT. Common resident. The Himalayas from Saded Koh, Hunza and Ladakh east to Sikkim. Breeds from the foothills (c. 450 m) up to 3000 m (N.W.F.P., Ladakh), 3600 m (Kashmir), 3900 m (Garhwal) and well above

× c. 1

4000 m (up to 4950 m, Diesselhorst) in Nepal where the Whitebreasted Dipper appears to be largely absent. In Sikkim recorded from the foothills to 2700 m; replaced higher up by *C. cinclus*. Withdraws from upper levels in winter (observed up to 2700 m but probably occurs much higher in Nepal). Affects mountain streams, usually larger and less torrential than those frequented by *C. cinclus*; but in Nepal, where the latter is absent, also occurs along small, rushing glacier torrents as well as on tarns. Has been observed chasing the whitebreasted species at 3900 m (Garhwal) and 3700 m (Lahul).

Extralimital. Adjacent parts of northern Afghanistan and north through Tadzhikistan to the Tien Shan.

GENERAL HABITS. Similar to those of *C. cinclus* (1773, q.v.). Keeps solitary on rocks amidst rushing torrents, the stumpy tail held partially cocked, and jerked up from time to time. Frequently dives from a floating position with a slight upward spring, like a dabchick, especially on tranquil pools and tarns, apparently doing so more regularly than the whitebreasted species.

(MD)

Weight 4 ♂♂ (Aug.-Oct.) 69.8-82.6; 2 ♀♀ (July, Dec.) 69, 72 g (GD, RAP).

COLOURS OF BARE PARTS. Iris brown. Bill dark brown or blackish brown. Legs and feet pale leaden in front, black behind; soles whitish to yellowish (Abbott).

1776. East Himalayan Brown Dipper. *Cinclus pallasi dorjei* Kinnear

Cinclus pallasi dorjei Kinnear, 1937, *Ibis*: 263 (Sakden, E. Bhutan)

Cinclus pallasi undina Koelz, 1954, Contrib. Inst. Regional Exploration, No. 1: 12 (Bara Pani, Khasi Hills)

Baker, FBI No. 480 (part), Vol. 2: 5

LOCAL NAMES. Chutia-nakka (Bhutanese); Di-dao-bui (Cachari).

SIZE. Myna ±; length c. 20 cm (8 in.).

FIELD CHARACTERS. As in 1775, q.v.

STATUS, DISTRIBUTION AND HABITAT. Common resident, subject to vertical movements. The eastern Himalayas from Chumbi Valley eastward through Bhutan and Arunachal Pradesh; the Cachar and Khasi hills, and Manipur; Chittagong Hill Tracts (Rashid). Breeds between c. 1000 and 4200 m; reaches the foothills in the non-breeding season. Affects rapid rocky mountain streams.

Extralimital. Northern Burma and southeastern Tibet.

GENERAL HABITS, FOOD AND VOICE. As in 1775.

BREEDING. Season, mainly December and January, occasionally till July. Nest and eggs as in 1775. Average size of 30 eggs 26.7 × 18.9 mm (Baker). Frequently brood-parasitized by *Cuculus canorus*.

MUSEUM DIAGNOSIS. Differs from *tenuirostris* in being darker. Young similar to *tenuirostris* but washed with rufous.

ACCENTORS OR 'HEDGE SPARROWS' 145

Genus PRUNELLA Vieillot

Prunella Vieillot, 1816, Analyse nouv. orn.: 43.
Type, by monotypy, *Motacilla modularis* Linnaeus
Laioctopus Gloger, 1841, Handb. in Hilsh.: 267.
Type, by monotypy, *Sturnus collaris* Scopoli

Bill finely pointed and slightly notched, wide at base and compressed towards the middle. Nostrils large, diagonal and covered by a membrane. Rictal bristles few and weak.

Cf. Marien, D., 1951, *Amer. Mus. Novit.*, No. 1482: 1-28

1777. Turkestan Alpine Accentor. *Prunella collaris rufilata* (Severtzov)

Accentor rufilatus Severtzov, 1879, Izvestia Obsht. Liub. Est. Anthr. Ethnog. Turkest. Otd. I: 45 (Turkestan)
Baker, FBI No. 621, Vol. 2: 189

LOCAL NAMES. None recorded.

SIZE. Sparrow; length c. 17 cm (6½ in.).

FIELD CHARACTERS. As in 1779, q.v.

STATUS, DISTRIBUTION and HABITAT. Resident, subject to vertical movements. N.W.F.P. from Safed Koh to Chitral, Baltistan, Gilgit and Astor, grading into *whymperei* in Ladakh. Breeds between 3600 and 5000 m, descends in winter to c. 1800 m. Affects stony slopes, cliffs and moraines above timber-line.

² As the species is a vertical, not a long-distance migrant throughout its range, it may be safe to assume that the Safed Koh breeding population belongs to this subspecies although there are no specimens.

ACCENTORS OR 'HEDGE SPARROWS' 147

COLOURS OF BARE PARTS. Adult as in 1777. Nestling. Bill bright pink with white edges to gape flanges; mouth bright orange-yellow with two black tongue-spots. Juvenile (fledged young). Iris brown. Bill horny, darker above; gape dark pinkish red; mouth orange, two black elongated spots at base of tongue. Legs and feet brown, joints and claws darker.

1779. Eastern Alpine Accentor. *Prunella collaris nipalensis* (Blyth)

A.(centor) Nipalensis Hodgson = Blyth, 1843, Jour. Asiat. Soc. Bengal 12: 958 (Kāchar region of Nepal)
Baker, FBI No. 620 (part), Vol. 2: 188
Plate 94, fig. 1

LOCAL NAMES. None recorded.

SIZE. Sparrow; length c. 17 cm (6½ in.).

FIELD CHARACTERS. Above, head greyish brown speckled with white around eye. Back streaked with dark brown. Rump and upper tail-coverts rufescent. Wing-coverts blackish brown with white tips forming two wing-bars. Tertiaries tipped with buff or whitish. Tail dark brown, each rectrix with a white or buff, roundish terminal spot. Below, chin and centre of throat white finely barred with brown. Sides of throat, breast and centre of belly grey. Flanks rusty with white tips on lower parts. Under tail-coverts dark brown edged with whitish. Sexes alike.

The plain grey breast easily distinguishes this species from *P. himalayana* (1780).

STATUS, DISTRIBUTION and HABITAT. Common resident, subject to vertical movements. Nepal, Darjeeling dist., Sikkim, Bhutan and Arunachal Pradesh. Breeds from c. 3700 m up to over 5500 m; in Nepal mostly above c. 4200 m. Observed at 7900 m on Mt Everest (Charles Evans, pers. comm.). Winters from c. 2400 m, seldom 2000 m, up to at least 4800 m. Affects rock-strewn meadows, cliffs, screes and moraines, particularly sunny slopes and open, snow-free patches on ridges; in winter also frequents upland villages.

Extralimital. Extends to northern Yunnan and central Szechuan.

GENERAL HABITS. Keeps in pairs in the breeding season; small loose parties of 4 or 5 birds (adults as well as young) from about the end of July. Flocking much in evidence in the beginning of September when flights of more than 20 birds may be seen. A very confiding bird, hopping about quietly on the ground or on large boulders in search of food.

Display. 'In a small foraging flock, an individual suddenly approached another with tail erect, then turned its back and quivered its wings. In another case only the tail was quivered. The subject of this attention did not react in any apparent way.' The scenes took place in the end of July and early August (Diesselhorst).

FOOD. Insects and small seeds; grit often found in stomachs.

146 PRUNELLIDAE

Extralimital. Adjacent parts of Afghanistan, Chinese and Russian Turkestan north to Ala Tau.

GENERAL HABITS, FOOD and VOICE. As in 1779.

BREEDING. As in 1779.

MUSEUM DIAGNOSIS. Similar to *whymperei* (1779) but grey-brown of plumage paler and greyer. Chestnut on flanks paler.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	95-105	c. 17	c. 24	68-71 mm
♀♀	89-102			
(Dementiev, Paludan, Marien)				
Weight 2 ♂♂ (June) 29, 32; 2 ♀♀ (June) 28, 29 g (Paludan). 1 ♂ (Nov.) 31 g (RAP).				

COLOURS OF BARE PARTS. Iris brown to reddish brown. Bill black, base of lower mandible yellow. Legs and feet reddish brown; soles yellow or yellowish.

1778. Garhwal Alpine Accentor. *Prunella collaris whymperei* (Baker)

Laioctopus collaris whymperei Baker, 1915, Bull. Brit. Orn. Cl. 35: 61 (Garhwal)
Baker, FBI No. 620 (part), Vol. 2: 188

LOCAL NAME. *Zanda tier* (Kashmir).

SIZE. Sparrow; length c. 17 cm (6½ in.).

FIELD CHARACTERS. As in 1779, q.v.

STATUS, DISTRIBUTION and HABITAT. Common resident, subject to vertical movements. The western Himalayas from Kashmir to Kumaon. Breeds between 3600 and 4500 m, descends to c. 1800 m in winter (November to March). Affects stony slopes, rocks and cliffs above timber-line.

GENERAL HABITS, FOOD and VOICE. As in 1779.

BREEDING. Season, June to August. Nest, a substantial compact cup of moss, grass and rootlets lined with moss and hair; placed under boulders or on rock ledges, or deep down between the stones of a glacier moraine. Eggs, 3, blue, unspotted; size c. 23 × 16 mm.

MUSEUM DIAGNOSIS. Darker than *rufilata* (1777) and less rufous than *nipalensis* (1779).

Young. Upperparts much as in adult but browner and duller, the feathers of the mantle edged browner, not so grey; no rufous on the scapulars; rump and upper tail-coverts greyish brown with paler fringes; chin and throat pale grey tinged with buffish, the tips of the feathers dull dark brown giving a speckled appearance; breast, abdomen, flanks, and lower tail-coverts ochraceous buff, brightest on the flanks, streaked with dark brown; wings and tail as in adult, but primary-coverts and greater and median wing-coverts browner, with the tips buffish, not white.

MEASUREMENTS

	Wing	Bill (from skull)	Tail
♂♂	93-102	15-16	62-70 mm
♀♀	91-94	15-16	56-63 mm
(Marien)			

148 PRUNELLIDAE

VOICE and CALLS. Call-note, usually uttered when flushed, a rippling, somewhat lark-like *chiriririp*, a low *chit-chittur* when in flocks. Song, similar to that of the central European (nominate) subspecies — a pleasant, varied warble of lark-like quality, uttered from a rock or in flight. Song period is over by the end of July.

BREEDING. Chiefly June and July; occasional fledglings may be seen in August. Single-brooded. Nest and eggs as in 1778. Three eggs measure 23 × 16, 22 × 16 and 21 × 16 mm (Ludlow).

MUSEUM DIAGNOSIS. Like *whymperei* (1778) but darker, more rufous. Complete moult in August-September.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	96-105	15-16	c. 25	{ 63-69 mm
♀♀	93-101			{ 65-67 mm
(Marien, Strea., SA)				

Weight 11 ♂♂ (June-Aug.) 31-38.5; 4 ♀♀ (June-Aug.) 29.3-36; 5 juv. 25.5-30.3 g (GD).

COLOURS OF BARE PARTS. As in 1777.

1780. Altai Accentor. *Prunella himalayana* (Blyth)

Accentor Himalayanus? Blyth, 1842, Jour. Asiat. Soc. Bengal 11: 187 (Himalaya range)
Baker, FBI No. 624, Vol. 2: 191
Plate 94, fig. 5

LOCAL NAMES. None recorded.

SIZE. Sparrow; length c. 15 cm (6 in.).

FIELD CHARACTERS. Above. Forehead, crown and nape greyish brown with dark streaks; a narrow greyish supercilium extending to nape. Back rufous-brown with dark brown streaks; rump greyish brown. Wings rufous-brown with two narrow white bars; inner remiges tipped with whitish. Tail dark brown with whitish terminal spots. Below, chin and centre of throat white, spotted with brown at sides. Breast, upper belly and flanks striped rufous and whitish; centre of belly whitish. Sexes alike.

The white gorget on chin and throat, rufous and whitish striped breast without any grey, and pale supercilium distinguish this species from the Alpine Accentor (*P. collaris*).

STATUS, DISTRIBUTION and HABITAT. Chiefly known as a winter visitor, fairly common, especially in the western Himalayas. Recorded from the Safed Koh and Gilgit east to Bhutan; also Arunachal Pradesh in the Miri Hills (*vide* Baker). Observed between 2000 and 4000 m, in the western parts of its range occasionally down to 1500 m, rarely 1000 m (Chamba); between 2800 and 4200 m (Nepal) and above 2400 m, rarely down to 2000 m (Sikkim). May be met with at these elevations from end September till end April, mostly between November and March. Breeding range little known. There is but one summer (July) record within our territory — a specimen in the Hume collection labelled 'Kashmir'. From adjacent areas, Baker

ACCENTORS OR 'HEDGE SPARROWS'

149

received nests from Yatung, Chumbi Valley 4200 m (Nidification 2: 165) and Koelz collected 3 specimens in July at Munjan Pass, Hindu Kush (Marien, 1951). Affects bare rocky hillsides, showing a decided preference

Prunella himalayana

■ Breeding

▨ Winter

for the shady side of the hills (Jones, JBNHS 16: 609). In summer appears to prefer stony ground in rather flat areas rather than scree and large boulders (Dementiev).

Extralimital. Ranges north through Turkestan to the Lake Baikal region. Also southeastern Tibet (Chumbi Valley).

GENERAL HABITS. More gregarious than *P. collaris*, being often seen in close-packed flocks of 30 to 100 or more birds, sometimes in company with Alpine accentors (*Prunella collaris*) and Mountain finches (*Leucosticte nemoralis*). Feeds on stony ground and is very inconspicuous while thus engaged. The birds hop about quietly among the stones, dodging in and out of crevices under boulders, often keeping up a low twitter. Flight rapid and finch-like. When disturbed, flocks fly back and forth round the contours of hillsides, rising and falling in disorderly undulations before settling again. When perching in a bare tree-top (in winter quarters) the birds bunch together like starlings at a roost.

FOOD. Insects and small seeds.

VOICE AND CALLS. 'Towards the end of their sojourn in the winter quarters an incessant warbling is uttered while searching the ground for food or when perched on a leafless tree' (Jones). Voice similar to that of *Serinus pusillus* (Dementiev). Call-note silvery and very finch-like (HW), also uttered on the wing.

ACCENTORS OR 'HEDGE SPARROWS'

151

Prunella rubeculoides

■ Distributional range

Extralimital. Southern Tibet to Szechuan, Kansu and Tsinghai.

GENERAL HABITS. Gregarious in winter. Usually fearless and confiding. Met with in small flocks commonly in villages, hopping stiffly on the ground like a sparrow, picking seeds out of animal dung. In summer keeps in pairs more in cover than the Alpine Accentor, and unlike it does not leave its breeding territory for foraging.

Display. Collective displays described by Schäfer (1938): Four males were observed chasing each other through light scrub with bat-like fluttering flight then alighting on a low shrub, sitting silently close to one another and fluttering their low-hanging wings. The same display also noted accompanied by singing. Another display involving ten males took place on the ground, the birds either dancing around or sitting still with hanging, whirring wings 'in highest ecstasy', this performance entirely silent.

FOOD. Insects and small seeds; grit often found in stomachs.

VOICE AND CALLS. Usual call, a trilled note similar to that of *P. strophilata* but sharper and more metallic; alarm-note, a bunting-like *zieh-zieh* (Schäfer). Another note or song is described as a pleasant but feeble *tilliti* (SA). Song described as 'sweet and short' — a simple, chirping *si-ti-si-ti*, *tsi-tsiti* (Schäfer). Song period, beginning of April to July.

BREEDING. Season, May to August, even early September. Apparently double-brooded. Nest, a bulky and compact cup of dry grass and moss thickly lined with hair, fur or feathers; placed on the ground among clumps of sedges or low down in thorny furze bordering streams, occasionally in a hollow in the bank of a stream. Eggs, 3 or 4, pale turquoise. Average size of 41 eggs 21.1 × 15.3 mm (BBO), of 60 eggs 19.5 × 14.5 mm (Baker).

150

PRUNELLIDAE

BREEDING. Little known; two nests received by Baker from the Chum Valley and one nest found in the Pamirs. Season, May to August. Nest, cup of grass more or less mixed with leaves, roots and fibre, lined with wool placed in a hollow under tussocks. Eggs, 4 or 5, blue, unspotted. Average size of 10 eggs 22.2 × 15.7 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters.

Young. Above, similar to adult but paler. Tail without terminal white spot. Below, throat slightly mottled greyish brown and buff. Breast ochraceous-buff with dark brown streaks. Rest of underparts cream-buff.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	89-99	14-15	22-26	{ 54-62 mm 51-56 mm
♀♀	88-94			

(Marien, MD, SA)

Weight 4 ♂♂ (Nov.) 25.5-29.8; 2 ♀♀ (Nov.) 24.3, 27.1 g (RAP, SA).

COLOURS OF BARE PARTS. Iris reddish brown or pale claret. Bill blackish brown, gape and base of lower mandible yellowish. Legs and feet yellowish brown to brownish flesh; claws horny brown.

1781. Robin Accentor. *Prunella rubeculoides* (Moore)

Accentor rubeculoides 'Hodgson' = Moore, 1854, Cat. Bds. Mus. E.I. Co. 1: 361 (Nepal)

Prunella rubeculoides muraria R. & A. Meinertzhagen, 1926, Bull. Brit. Orn. Cl. 46: 99 (Astor)

Baker, FBI No. 626, Vol. 2: 193
Plate 94, fig. 3

LOCAL NAME. Phoo-ching-pho (Lepcha).

SIZE. Sparrow; length c. 17 cm (6½ in.).

FIELD CHARACTERS. Above, head brownish grey. Rest of upperparts pale brown with darker streaks on back and two whitish wing-bars. Below, throat brownish grey; breast rufous; belly pale cream, lower flanks streaked with rufous-brown. Sexes alike.

Distinguished from *P. strophilata* (1782-3) by entirely grey head and throat, without supercilium.

STATUS, DISTRIBUTION AND HABITAT. Common resident, subject to vertical movements. Occurs in Tibetan Plateau facies from Balistan (Richmond, 1895), Astor and Ladakh east to northern Bhutan and probably Arunachal Pradesh. Breeds between 3600 and 5300 m, locally down to 3000 m (Suru); in eastern Nepal between 4500 and 5000 m. Descends in winter to c. 2700 m (Ladakh), 2500 m (Sikkim), exceptionally lower (Rampur, c. 1000 m, Himachal Pradesh) and Singhiik 1200 m (Sikkim). Affects dwarf willows, and furze (*Caragana*) patches in the neighbourhood of streams, tundra-like vegetation and sedge tussocks around lakes, and low scrub in valley bottoms, not ascending far up the flanking slopes. Has a decided liking for wet and swampy areas but in winter also frequents stony and rocky ground in the barest places. In this season also seen in and around upland villages.

152

PRUNELLIDAE

MUSEUM DIAGNOSIS. See Field Characters.

Young. Above, very dark brown streaked with ochraceous buff; a pale supercilium. Wing as in adult but darker. Below, throat mottled whitish and dark brown. Breast and flanks streaked ochraceous and dark brown. Belly cream colour.

Very similar to young of *P. strophilata* but distinguished by unstreaked belly.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	75-86	13-15	23-24	{ 59-69 mm 60-65 mm
♀♀	72-79			

(Marien, HW, Strea.)

Weight 4 ♂♂ (July-Sept.) 23.2-25.7; 3 ♀♀ (July-Sept.) 21.2-24.1; 3 juv. 20.5-22.5 g (GD).

COLOURS OF BARE PARTS. Iris pale brown to reddish brown. Bill black. Legs and feet pale reddish brown; claws black.

PRUNELLA STROPHILATA (Blyth)

Key to the Subspecies

Darker, more heavily streaked..... *P. s. strophilata*
Paler, less heavily streaked..... *P. s. jerdoni*

1782. Western Rufousbreasted Accentor. *Prunella strophilata jerdoni* (Brooks)

Accentor Jerdoni Brooks, 1872, Jour. Asiat. Soc. Bengal 41: 327 (Kashmir)

Prunella strophilatus siroietensis Koelz, 1939, Proc. Biol. Soc. Washington 52: 67 (Sirotai, Afghanistan)

Baker, FBI No. 629, Vol. 2: 197

LOCAL NAMES. None recorded.

SIZE. Sparrow; length c. 15 cm (6 in.).

FIELD CHARACTERS. General aspect rufous-brown very dark-streaked above, with rufous breast and mottled whitish throat. Above, brown streaked with blackish on crown and back. Two pale wing-bars. A conspicuous supercilium, whitish in front, rufous and broader behind eye; cheeks dark brown changing to rufous on ear-coverts. Below, throat ashy white streaked with blackish brown; breast rufous; belly whitish with dark brown streaks. Sexes alike.

Distinguished from *P. rubeculoides* (1781) by streaked throat and belly and prominent supercilium; from *P. himalayana* (1780) by rufous supercilium, streaked whitish throat, unstreaked rufous breast, and dark brown streaks on belly.

STATUS, DISTRIBUTION AND HABITAT. Common resident, subject to vertical movements. From Barwatin Valley and Sirotai (Afghanistan) north through N.W.F.P. to Shandur Pass (Gilgit), thence east along the Himalayas including Kashmir and Ladakh to Kumaon, intergrading with *strophilata* in western Nepal. Breeds from c. 2700 m up to the limit of dwarf scrub (c. 3600 m on Safed Koh, and in Ladakh and Lahul; 4000 m in Gushwal). Descends in winter to 1200 m, seldom lower (Kangra 600 m, Nurpur

ACCENTORS OR 'HEDGE SPARROWS'

153

Shapan and Sakesar, Salt Range). Affects fir and birch forest, pine, *kharshu* oak with rhododendron scrub, and juniper, willow and bracken scrub above timber-line. In winter frequents scrub jungle, wooded nullahs and

Prunella strophliata

Distributional ranges

jerdoni (1782)

strophliata (1783)

occasionally gardens, and weed undergrowth on deserted village or graziers' encampment sites. Partial to a moister habitat than the Blackthroated accentor's.

Extralimital. Adjacent parts of eastern Afghanistan.

GENERAL HABITS. Behaviour typically hedge-sparrowlike; keeps to the ground and avoids flying in the open. Lives in pairs in the breeding season, otherwise singly or in small parties of two to eight individuals or larger flocks, hopping about quietly and feeding at the base of bushes. Is a great skulker; when disturbed works its way with great speed through the root-stocks and tangles of branches. When flushed dives abruptly to the base of some bush after a hurried hedge-hopping flight. Has the characteristic nervous flicking of wings of the familiar *P. modularis* of Europe.

FOOD. Insects and small seeds.

VOICE AND CALLS. Song very wren-like (*Troglodytes*) but less loud and interspersed with occasional harsher notes. Alarm-note, a high-pitched chattering *tir-r-r*.

BREEDING. Season, May to August. Nest, a deep cup of weed stems, moss and lichen, lined with fine grass, hair and feathers; placed in dwarf rhododendrons, junipers or other scrubby bushes, or in a lower branch of a conifer, sometimes as high as three metres above the ground. Eggs, generally 4, sometimes 3, rarely 5, turquoise-blue, unspotted. Average size of 40 eggs

Plate 94, fig. 9

LOCAL NAMES. None recorded.

SIZE. Sparrow; length c. 15 cm (6 in.).

FIELD CHARACTERS. Above, pale brown with darker streaks on back. A conspicuous long white supercilium and dark brown 'cheeks'. Two faint whitish wing-bars. Below, buffish, more ochraceous on breast. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Uncommon resident, subject to vertical movements. Hunza, Astor, Baltistan and Ladakh to Rupshu. In winter to Chitral, Gilgit and Lahul. Breeds between 3300 and 5100 m. Winters down to c. 1500 m (October to March). Affects Tibetan fir (*Ceragena*) on mountain slopes, in the same habitat as *P. rubeculoides* but appears to prefer a drier biotope.

Extralimital. Ranges west to central Afghanistan and north to the Tien Shan. The species extends to the Sayans, Kansu and Szechuan.

GENERAL HABITS. Little recorded. Met with in small flocks up to ten individuals in winter. Feeds on the ground, hopping quietly among bushes and stones.

FOOD. Unrecorded.

VOICE AND CALLS. Little recorded. Song, a short, low warble (Dementiev); period April through June.

BREEDING. Season, May to August. Nest, a cup of grass and fibres lined with wool, hair and vegetable down; placed in low shrubs up to c. 60 cm

154

PRUNELLIDAE

19 × 13.8 mm (Baker), of 19 eggs 18.6 × 13.8 mm (BBO). Incubation and care of young by both sexes.

MUSEUM DIAGNOSIS. See Field Characters. For distinction from *strophliata* see 1783.

Young. Above, like adult but more rufescent. Supercilium whitish. Below, entirely streaked with blackish, the breast ochraceous buff, the throat and belly whitish. Very similar to the young of *P. rubeculoides* but distinguished by streaked belly.

MEASUREMENTS. As in 1783.

Weight 1 ♂ (June) 16 g (Paludan); 1 ♀ (Oct.) 18.7 g (RAP).

COLOURS OF BARE PARTS. As in 1783.

1783. **Eastern Rufousbreasted Accentor.** *Prunella strophliata strophliata* (Blyth)

A. (accentor) strophliatus 'Hodgson' = Blyth, 1843, Jour. Aviat. Soc. Bengal 12: 959 (Nepal)

Plate 94, fig. 2

LOCAL NAME. Phoo-ching-pho (Lepcha).

SIZE. Sparrow; length c. 15 cm (6 in.).

FIELD CHARACTERS. As in 1782, q.v. When hopping about, the broad orange-rufous eyebrow is strikingly prominent.

STATUS, DISTRIBUTION AND HABITAT. Common resident, subject to vertical movements. The Himalayas from western Nepal eastward through Sikkim, Bhutan and Arunachal Pradesh. Breeds between 3600 and 4200 m (western Nepal), 3800 and 5000 m (eastern Nepal), 3400-4300 m (Bhutan). Winters between 1300 and at least 3600 m. Affects dense rhododendron jungle near timber-line and especially dwarf juniper and rhododendron above this limit; locally also scrubless, boulder-strewn alpine meadows in same habitat as *P. collaris* (Gosainkund, Nepal — Deshayes). In winter (November to March) frequents open scrubby meadowland, bushes in fallow fields near villages or around abandoned cattle sheds, preferring xerophilous scrub to any other vegetation (Schäfer).

Extralimital. Southeastern Tibet, northern Burma, Yunnan and the mountains of western China north to Tsinghai, Kansu and Shensi.

GENERAL HABITS. As in 1782.

FOOD. Insects and larvae, worms, small seeds and some vegetable matter; grit often recorded.

VOICE AND CALLS. As in 1782. Alarm-note rendered as *zwitt-twitt*, *twitt*, *twitt* (Schäfer).

BREEDING. As in 1782. Clutch size 3 or 4. Average size of 80 eggs 19.4 × 14.4 mm (Baker).

MUSEUM DIAGNOSIS. Darker than *jerdoni*, more heavily streaked with darker streaks above and on flanks; more rufous supercilium, and darker orange pectoral band.

156

PRUNELLIDAE

Prunella fulvescens

Distributional ranges

1 fulvescens (1784) 2 sushkini (1785) 3 ocularis (1785a)

4, 5 Extralimital subspecies

above the ground. Eggs, 3 or 4, blue, indistinguishable from those of *P. rubeculoides*. Average size of 7 eggs 19.2 × 13.9 mm (Osmaston).

MUSEUM DIAGNOSIS. See Field Characters. For distinction from *P. f. sushkini* see 1785. Postnuptial moult complete, September and October.

Young. Above, as adult but a little more rufescent. Supercilium mixed with brown. Ear-coverts not so dark. Below, throat whitish with dusky spots; rest of underparts ochraceous buff, breast streaked with dark brown.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	71-81	13-15	c. 20	61-68 mm
♀♀	72-79			59-66 mm

(Marien, Dementiev, MD)

Weight 1 ♂ (Sept.) 20 g (Paludan).

COLOURS OF BARE PARTS. Iris pale brown. Bill black. Legs and feet pale reddish brown.

1785. **Tibet Brown Accentor.** *Prunella fulvescens sushkini* Collin & Hartert

Prunella fulvescens sushkini Collin & Hartert, 1927, Novit. Zool. 34: 52. New name for *Prunella fulvescens tibetensis* Sushkin, see *Accentor collaris tibetensis* Bianchi

Prunella fulvescens tibetensis Sushkin, 1925, Proc. Boston Soc. Nat. Hist. 38: 53 (Khamba-jong, Tibet)

Baker, FBI No. 630 (part), Vol. 2: 198

LOCAL NAMES. None recorded.

ACCENTORS OR 'HEDGE SPARROWS'

157

SIZE. Sparrow; length c. 15 cm (6 in.).
FIELD CHARACTERS. As in 1784, q.v.
STATUS, DISTRIBUTION and HABITAT. Two winter records: Jomosum, 2800 m, Nepal (Rand & Fleming, 1957: 183) and Sikkim (Mandelli). Probably breeds at very high altitudes in Tibetan facies north of the main range as it does in the Mt Everest region (JBNHS 32: 323). May be expected in winter in Bhutan and Arunachal Pradesh since the species is common in adjacent Tibet (Ibis 1944: 192). Breeds between 3600 and 5000 m; descends in winter to c. 2100 m. Affects Tibetan furze, willows and other low scrub on dry, rocky, boulder-strewn hillsides. In winter also frequents villages.
Extralimital. Southern and southeastern Tibet.
GENERAL HABITS. As a rule very confiding; less secretive than *P. strophliata*, often feeding in the open or perching on rocks or walls. In winter commonly searching food amongst village refuse in the streets, on manure heaps, and on roofs of houses.
FOOD. Insects and seeds.
VOICE and CALLS. Call-note, a bunting-like *ziel, ziel, ziel*; alarm-note, a tinny rattle similar to that of *P. rubeculoides*. Song (heard in January) long-drawn and rattling, 'like a bad, slow Robin Redbreast song' (Schäfer).
BREEDING. As in 1784. One nest was found in a deep gap between ration boxes of a Mt Everest expedition camp. Average size of 60 eggs 19.5 × 14.3 mm (Baker).
MUSEUM DIAGNOSIS. Differs from the nominate race (1784) in having the upperparts more heavily streaked and the breast richer ochraceous.
MEASUREMENTS and COLOURS of BARE PARTS. Unrecorded; probably as in 1784.

1785a. Radde's Accentor. *Prunella fulvescens ocularis* (Radde)

Accentor ocularis Radde, 1884, Ornith. Caucasica: 244, pl. 14 (Kiz Yurdi Mt., Talych) Baker, FBI Vol. 8: 626
Plate 94, fig. 7

LOCAL NAMES. None recorded.
SIZE. Sparrow; length c. 15 cm (6 in.).
FIELD CHARACTERS. As in 1784, but with prominent white malar stripes in addition to supercilium.
STATUS, DISTRIBUTION and HABITAT. Accidental. A record from Chaman, northern Baluchistan (JBNHS 31: 711); specimen in BNHS collection. Habitat as in 1784.
Extralimital. Breeds from extreme eastern Turkey, Georgia and Armenia southeast to southern Iran, and east along the Elburz Mts to the Kopet Dag.
GENERAL HABITS, FOOD and VOICE. Unrecorded.
BREEDING. Extralimital.
MUSEUM DIAGNOSIS. Distinguished from *fulvescens* (1784) by darker crown, concolorous with ear-coverts, heavier streaking on back and a fine malar line of brown spots in some individuals. Flank-feathers with dark brown centres.
MEASUREMENTS
Wing 5 ♂♂ 73-77; 1 ♀ 71 mm (Dementiev)
COLOURS of BARE PARTS. Unrecorded.

ACCENTORS OR 'HEDGE SPARROWS'

159

42: 716) and east along the Himalayan foothills to Dehra Dun; in the hills up to c. 2500 m but mostly below 1800 m. Affects scrub jungle on hillsides, tea gardens, orchards and bushes near cultivation; in the Punjab plains affects sandy semi-desert near cultivation and tussocks of *sarpat* grass.
Extralimital. Breeds in Turkestan north to the Altai. Moves vertically with the seasons and also reaches Iran and Afghanistan.
MIGRATION. Arrives about the middle of October (earliest 29 September), remains until the third week of March (latest 15 April).
GENERAL HABITS. Usually seen singly or in pairs, sometimes in small parties. More a bird of bushes than the very similar *P. fulvescens*, and usually found at lower elevations. Habits similar to those of the well-known *P. modularis* of Europe, but more gregarious. At times associates with *P. strophliata*. Feeds on the ground, shuffling around the base of bushes, nervously flicking its wings. On being disturbed perches freely on bushes and in the lower branches of trees.
FOOD. Insects, ants, small seeds.
VOICE and CALLS. Only note recorded in winter quarters, a soft *trrl*.
BREEDING. Extralimital.
MUSEUM DIAGNOSIS. See Field Characters. For distinction from nominate *atrogularis* see 1787.
MEASUREMENTS

	Wing	Bill (from skull)	Tail
♂♂	70-79	13-15	60-71 mm
♀♀	71-77	12-15	59-68 mm

(Marien, NBK)
arsus c. 21 mm
Weight 5 ♂♂ (Nov.-Dec.) 17.8-20; 2 ♀♀ (Dec.) 17.1, 19.4 g — RAP.
COLOURS of BARE PARTS. Iris brown. Bill black. Legs and feet brownish flesh.

1787. Ural Blackthroated Accentor. *Prunella atrogularis atrogularis* (Brandt)

Accentor atrogularis [sic] Brandt, 1844, Bull. Phys. Acad. Imp. Sci. St. Pétersb. 2, col. 140 (Semipalatinsk) Baker, FBI No. 627 (part), Vol. 2: 194
Plate 94, fig. 6

LOCAL NAMES. None recorded.
SIZE. Sparrow; length c. 15 cm (6 in.).
FIELD CHARACTERS. As in 1786, q.v.
STATUS, DISTRIBUTION and HABITAT. Scarce winter visitor to Pakistan. Recorded from Gilgit and Punjab (Jhang, Jhelum and Bahawalpur dists.). Habitat as in 1786.
Extralimital. Breeds in the northern Urals. Winters within the winter range of *huttoni* but more commonly in the western parts (Afghanistan).
GENERAL HABITS, FOOD and VOICE. As in 1786.
BREEDING. Extralimital.

158

PRUNELLIDAE

PRUNELLA ATROGULARIS (Brandt)

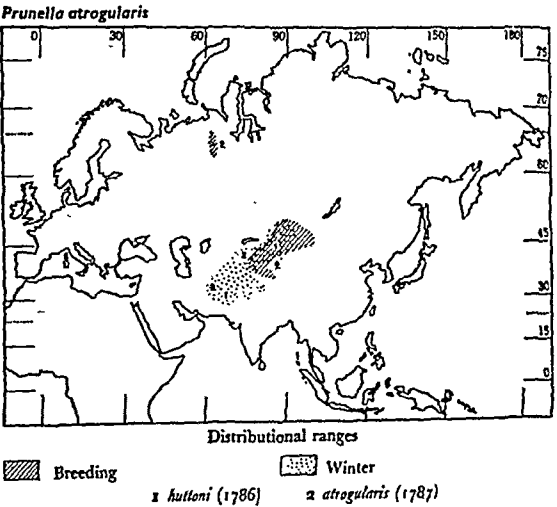

Key to the Subspecies

A faint whitish band between bib and breast....*P. a. atrogularis*
No whitish band between bib and breast.....*P. a. huttoni*

1786. Turkestan Blackthroated Accentor. *Prunella atrogularis huttoni* (Moore)

Accentor huttoni Moore, 1854, in Horsfield & Moore, Cat. Bds. Mus. E.I. Co. 1: 360, new name for *A. atrogularis* Hutton, 1849, Jour. Asiat. Soc. Bengal 18: 811 (Simla), nec *A. atrogularis* Brandt, 1844 Baker, FBI No. 627 (part), Vol. 2: 194

LOCAL NAMES. None recorded.
SIZE. Sparrow; length c. 15 cm (6 in.).
FIELD CHARACTERS. Above, brown streaked with darker brown on back. Ear-coverts dark brown. A buff supercilium bordered above with dark brown. Two pale wing-bars. Below, chin and centre of throat ('bib') blackish brown. Sides of throat, breast and flanks rich buff, the latter with dark brown streaks. Centre of belly cream-buff. Sexes alike.
Very similar to *P. fulvescens* but distinguished by blackish bib.
STATUS, DISTRIBUTION and HABITAT. Winter visitor, fairly common locally. Pakistan from Hunza and Balistan south to northern Baluchistan (Quetta, Fort Sandeman, Ziarat), the Salt Range, Bahawalpur (JBNHS

160

PRUNELLIDAE

MUSEUM DIAGNOSIS. Differs from *huttoni* in being paler and less heavily streaked above, and having a faint whitish band between the black of throat and the buff of breast. Bill and tail average shorter.
MEASUREMENTS

	Wing	Bill (from skull)	Tail
♂♂	71-77	11-14	60-66 mm
♀♀	70-74	11-13	56-62 mm

(Marien)

COLOURS of BARE PARTS. As in 1786.
1787a. Siberian Accentor. *Prunella montanella montanella* (Pallas)
Motacilla montanella Pallas, 1776, Reise versch. Prov. Russ. Reichs 3: 695 (Dauria) Not in Baker, FBI Plate 94, fig. 8

LOCAL NAMES. None recorded.
SIZE. Sparrow; length c. 15 cm (6 in.).
FIELD CHARACTERS. Very similar to Blackthroated Accentor but throat buff and breast spotted with black. Back more chestnut-brown.
STATUS, DISTRIBUTION and HABITAT. Straggler. One record: Dras c. 3000 m, Ladakh, 15 April (Meinertzhagen, Ibis 1927: 595). Affects bushes and forest edges, especially along streams.
Extralimital. The species breeds in Siberia from the Ural and Sayan Mts east to Anadyr. Winters from Kansu to Korea and Japan.
GENERAL HABITS and FOOD. As in 1786.
VOICE and CALLS. Said to be very similar to those of *P. atrogularis*.
BREEDING. Extralimital.
MUSEUM DIAGNOSIS. See Field Characters.
MEASUREMENTS
Wing ♂♂ 70-74; ♀♀ 65-73 mm
Weight 3 ♂♂ 17-17.7; 1 ♀ 17.5 g (Dementiev).
COLOURS of BARE PARTS. Iris light brown. Bill blackish, base of lower mandible yellowish. Legs and feet yellowish brown.

1788. Maroonbacked Accentor. *Prunella immaculata* (Hodgson)

Acc.(entor) immaculatus Hodgson, 1845, Proc. Zool. Soc. London: 34 (central and northern regions of the Hills, Nepal) Baker, FBI No. 625, Vol. 2: 193
Plate 94, fig. 4

LOCAL NAMES. None recorded.
SIZE. Sparrow; length c. 15 cm (6 in.).
FIELD CHARACTERS. A dark, slaty grey accentor with pale yellow eye. Chestnut wings and rufous vent. Above, crown and nape slaty, forehead scalloped with white; back and rump rufescent olive-brown and maroon. A large shoulder-patch and edge of wing slaty grey; tertials chestnut. Tail slaty brown. Below, throat to belly dark grey; lower flanks, vent and under tail-coverts chestnut; thighs slaty. Sexes alike.

ACCENTORS OR 'HEDGE SPARROWS'

161

STATUS, DISTRIBUTION and HABITAT. Scarce resident, subject to vertical movements. Eastern Nepal,¹ Darjeeling, Sikkim, Bhutan and Arunachal Pradesh ('common locally both north and south of the main range in southeastern Tibet' — Ludlow). Breeds between 2900 and 4200 m (south-eastern Tibet). Winters between 2100 and 3700 m (Nepal, Sikkim, Bhutan),

Prunella immaculata

Distributional range

down to 1500 m (Tibet). Affects humid, mossy conifer and rhododendron forest; in winter secondary jungle, edges of clearings with brushwood and fallen tree-trunks, forest margins near harvested terraced fields and boggy nullahs etc.

Extralimital. Extends to northern Yunnan and northern Szechuan.

GENERAL HABITS. Keeps singly or in pairs in summer, in small parties outside the breeding season. The most secretive of all our accentors. Feeds quietly on the ground, close under bushes, seldom venturing into the open. When disturbed dashes out furtively in hurried twisting hedge-hopping flight and disappears in a flash round the next bush. This tactic repeated again and again on being followed. In summer also frequents the tops of conifers 'where it utters an off-repeated monotonous two-syllabled call' (Ludlow).

FOOD. Insects, pupae, seeds.

VOICE and CALLS. Call-note, a metallic *zieh-dzit* (Schäfer). Song unrecorded.

¹ A nest allegedly taken in Ladakh (Baker) was almost certainly misidentified. A supposed sight record from Dunchuk nala, 3900 m, two marches from Astor (Littledale, 1889, JBNHS 4: 115) is certainly erroneous. There are no forests at that altitude in Astor, which eliminates the possibility *ipso facto*.

11

TRUE TITS

163

x c. 1

Female similar but back blackish olive, throat yellowish olive.

In overhead flight, silhouetted against sky, looks very like a bulbul (*Pycnonotus*). Tail comparatively long and partly spread.

STATUS, DISTRIBUTION and HABITAT. Resident, common east of Darjeeling. The Himalayan foothills from central Nepal (JBNHS 60: 177) east through Darjeeling, Sikkim, Bhutan, Arunachal Pradesh and adjacent plains, thence south through Meghalaya, Nagaland, Manipur, Mizoram and the hills of Bangladesh to the Chittagong region. More common below c. 700 m, but locally up to c. 1900 m. Affects foothills forest, deciduous and evergreen, with a preference for the latter, especially along jungle paths, roads, etc. where growth not too dense; also large trees near cultivation.

Extralimital. Ranges east to northern Thailand and south to Tenasserim. The species extends to Sumatra, Vietnam, Hainan and Fukien.

GENERAL HABITS. Essentially tit-like. Keeps in pairs or small parties of up to ten or so — often in the mixed associations. Hunts for insects in bushes and the foliage canopy of lofty trees, clinging to sprigs and trunks in all manner of acrobatic positions, peering under leaves or into crevices of the bark. Actions slower than other tits. Flits lightly from branch to branch, the peculiar hovering flight reminiscent of an iora's parachuting display or of wood shrikes (*Tephrodornis*) in a foraging party. The recumbent crest is erected when the bird is excited.

FOOD. Chiefly insects — grasshoppers, mantises, etc., but also fruit and seeds.

VOICE and CALLS. Song, a musical jingling *tee-r-r* usually repeated three times, or *tirree, tiri*, punctuated by harsh *chur-chur* or *chuchuk* (like a quaker babbler's but louder). Call-note, a rather nasal, short *chick* (like a small woodpecker's) given while foraging in parties, or a shrill *chip-tree-trr*. Alarm-note, a harsh rolling *krikree* like the alarm-note of some laughing thrush, and a shrill chattering note like a Grey Tit's. A plaintive, high-pitched *puay-puay-puay* is sometimes heard.

BREEDING. Season, April to July. Nest (only a couple described) a thick pad of moss heavily lined with vegetable down; placed in a hollow or crack in a tree-trunk. Eggs 6 to 7, broad ovals, chalky white, scattered all over with brownish red spots and underlying ones of pinkish grey. Average size of 5 eggs from a clutch of seven 19 × 15.3 mm; another clutch of 6 eggs averaged 21.7 × 16.5 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters.

162

PARINAE

BREEDING. Not satisfactorily recorded. Baker describes nests built 'in furze... above the tree-limit in the bleakest and barest of hillsides', a rather unlikely habitat for this pre-eminent forest-haunting species. Season, given as about May to July. Eggs (if correctly identified) 3 or 4, blue; average size of 50 eggs 19.5 × 14.6 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters.

Young. Above, head olive-grey, no whitish on forehead. Back rufescent olive, each feather tipped with black; rest of upperparts like adult. Below, throat whitish spotted with blackish; breast buff streaked with dark brown; belly and under tail-coverts ochraceous.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	76-87	13-15	22-25	{ 55-59 mm
♀♀	74-81			{ 50-59 mm

(Marien, SDR, Stevens, SA)

Weight 1 ♀ (winter) 19; 2 oo? (winter) 20.5, 22.5 g (SA).

COLOURS OF BARE PARTS. Iris pale yellow in winter but from mid February onwards, the iris in most birds of both sexes assumes an outer ring of bright orange-brown which in some cases fades immediately after death (Stanford). Bill black. Legs and feet pale brownish flesh or flesh-pink to almost white.

Family PARIDAE: Tits or Titmice

Subfamily PARINAE: True Tits

For description see Witherby, H. F., *et al.*, 1938, 1: 244-5; Van Tyne, J. & Berger, A. J., 1959: 512; Snow, D. W., 1964, article 'Tit' in Thomson, A. L. (ed.), *A New Dictionary of Birds*, London & New York.

Melanochlora Lesson, 1839, Rev. Zool. 2: 42. Type, by subsequent designation,

Melanochlora sumatrana Lesson

Wing long and pointed. Nostrils slightly exposed. Bill and feet as in *Parus*.

1789. Sultan Tit. *Melanochlora sultanea sultanea* (Hodgson)

Parus sultaneus Hodgson, 1837, Ind. Rev. 2(1): 31 (central and northern regions of the Hills, Nepal)

Baker, FBI No. 87, Vol. 1: 101

Plate 95, fig. 20

LOCAL NAMES. Bon-lyia-pho (Lepcha); Dao-rajah-gatang-liti (Cachari).

SIZE. Bulbul; length c. 20 cm (8 in.).

FIELD CHARACTERS. A showy, yellow-crested, black-and-yellow arboreal bird.

Male. Above, forehead, crown and long crest bright yellow; rest of upperparts black, back with a metallic greenish cast. Below, throat black; rest of underparts bright yellow.

164

PARINAE

Young as adult but glistening black replaced by dull brownish black; yellow of underparts paler. Narrow yellow tips to greater wing-coverts; crest shorter.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	103-113	16-18	22-26	{ 93-98 mm
♀♀	95-108			{ 85-93 mm

(SA, NBK, BB)

Weight 2 ♂♂ 38, 41; 2 ♀♀ 35, 36.3 g (SDR, RAP, SA).

COLOURS OF BARE PARTS. Iris brown. Bill brownish black. Legs and feet bluish plumbeous; claws horny brown.

Genus PARUS Linnaeus

Parus Linnaeus, 1758, Syst. Nat., ed. 10, 1: 189.

Type, by subsequent designation, *Parus major* Linnaeus

Lophophanes Kaup, 1829, Skizz. Nat. Syst.: 92.

Type, by original designation, *Parus cristatus* Linnaeus

Maclotophus Cabanis, 1851, Mus. Hein. 1: 91.

Type, by subsequent designation, *Parus spilonotus* Bonaparte

Cf. Vaurie, C., 1950, *Amer. Mus. Novit.*, No. 1459: 1-66.

Bill short, conical; nostrils concealed by bristles. Rictal bristles short. Tarsus well developed, scutellated. Wing weak and rounded. Tail shorter than wing.

1790. Baluchistan Grey Tit. *Parus major ziaratiensis* Whistler

Parus major ziaratiensis Whistler, 1929, Bull. Brit. Orn. Cl. 50: 7 (Ziarat, Baluchistan)
Baker, FBI No. 52 (part), Vol. 1: 76

LOCAL NAMES. None recorded.

SIZE. Sparrow \pm ; length c. 13 cm (5 in.).

FIELD CHARACTERS. As in 1792, q.v.

STATUS, DISTRIBUTION AND HABITAT. Common resident, subject to vertical movements. The higher wooded mountains of northern Baluchistan. Affects juniper forest. Descends to the lower valleys in winter when it may be seen in the gardens of Quetta, and perhaps to Sind (JBNHS 66: 25).

Extralimital. Adjacent parts of Afghanistan to Herat and Kandahar.

GENERAL HABITS, FOOD AND VOICE. As in 1792.

BREEDING. As in 1792.

MUSEUM DIAGNOSIS. The palest of Indian Grey Tits. Differs from *caschmirensis* in the paler and bluer grey of upperparts, more conspicuous white edging to tertials, and smaller bill.

MEASUREMENTS

TRUE TITS

167

1792. Kashmir Grey Tit. *Parus major caschmirensis* Hartert

Parus major caschmirensis Hartert, 1905, Vög. pal. Fauna 1: 345 (Gilgit)
Baker, FBI No. 53, Vol. 1: 76

LOCAL NAMES. *Ranga tior*, *Dentian* (Kashmir).

SIZE. Sparrow \pm ; length c. 13 cm (5 in.).

FIELD CHARACTERS. Above, crown black; cheeks white; back grey; a whitish patch on nape. Wings dark brown, tertials broadly edged with pale ash; a white wing-bar. Tail blackish with white outer rectrices. Below, throat black continued in a broad black band running down the middle of underparts; flanks ash. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Common resident, subject to vertical movements. The western Himalayas from Hazara, Chitral and Hunza east through Ladakh, Kashmir, and Himachal Pradesh (Kulu, Kangra, Lahul) to Kumaon. Breeds between c. 1000 and 1800 m, locally 2400 m; in Chitral and Ladakh up to 3600 m wherever there are a few trees in the valleys. Descends to lower elevations in winter (October to March) and spreads into the plains of northern Punjab. Affects lighter forested areas, edges of cultivation, open hillsides with scattered bushes, gardens, groves, orchards and hedgerows.

Extralimital. NE. Afghanistan (Nuristan - Paludan).

GENERAL HABITS. Usually seen in pairs or in small scattered parties, often in company with various tits, nuthatches, tree creepers, leaf warblers, and other small insectivorous birds. A familiar and sprightly bird, exploring energetically the leaves and branches of trees and bushes, clinging in all manner of acrobatic positions, often hanging to sprigs upside down, and intermittently uttering its cheerful call-notes. When greatly excited, as when chivvying an owl or snake, repeatedly bobs forepart of body vehemently and nervously twitches wings like a *Phylloscopus* while hopping around and swearing at the unwelcome presence. Often descends to the ground and hops about in search of food or nesting material, sometimes even entering bungalow verandas in the quest.

FOOD. Insects, caterpillars, seeds, flower buds and berries. If too large to swallow whole, insects held underfoot and devoured piecemeal. Similarly kernels of hard-shelled seeds hacked out by repeated hammer-blows with the strong conical bill.

VOICE AND CALLS. Ordinary call-note *tee tee tee* given while foraging. Song, a variety of loud and clear whistling notes such as *zwick zwick*, a sawing *weeter-weeter-weeter* . . . and a three-syllabled *whet-chet-chet* repeated several times (HW). Alarm, a harsh churring note.

BREEDING. Season, early April to July. Nest, a pad of moss lined with wool and hair; placed in a hole in the wall or roof of a building, tree or stump, a roadside bank (a common site), a rat-hole in a sloping hillside or a deserted kingfisher burrow. Eggs, 4 to 6, occasionally up to 5, white, speckled with reddish brown. Average size of 31 eggs 17.5 \times 13.4 mm (Osmaston), of 100 eggs 17.2 \times 13.4 mm (Baker).

MUSEUM DIAGNOSIS. Paler than *decolorans* but darker than *ziaratiensis* (Vaurie). Grey predominates on central rectrices. Blue fringes of greater coverts broad so that coverts appear blue. White wedge on inner web of second outer rectrix very long.

SIZE. Sparrow \pm ; length c. 13 cm (5 in.).

FIELD CHARACTERS. As in 1792, q.v.

STATUS, DISTRIBUTION AND HABITAT. Common resident, subject to vertical movements. N.W.F. Province in the Safed Koh region and adjacent parts of eastern Afghanistan (however see Paynter, JBNHS 59: 952). Affects forest of oak, juniper, and scrub around cultivation, breeding above c. 1500 m.

GENERAL HABITS, FOOD AND VOICE. As in 1792.

BREEDING. As in 1792.

MUSEUM DIAGNOSIS. Differs from *ziaratiensis* in having the back darker and underparts more smoky. Differs from *caschmirensis* by the smoky (i.e. white) underparts and in having more black on the second outer rectrix.

MEASUREMENTS

Wing 6 ♂♂ 71-78; 4 ♀♀ 70-72 mm (Koelz)

COLOURS OF BARE PARTS. As in 1792.

168

PARINAE

20 to 45 mm, almost always over 30 mm. Outer web of second outer rectrix almost entirely white.

Young. Above, crown dark, dull brown; cheeks dull yellowish white; back washed with olive-green. Below, pale yellow; a narrow dark brown band from chin to lower belly. Wings and tail as in adult.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	72-78	12-13	17-20	60-71 mm
♀♀	68-73	11-13	18-20	56-62 mm

(HW)

Weight 17 ♂♂ 14.1-17.1 (av. 15.6); 16 ♀♀ 13.2-16.2 (av. 14.3) g — RAP.
COLOURS OF BARE PARTS. Iris dark brown. Bill black. Legs and feet plumbeous.

1793. Nepal Grey Tit. *Parus major nipalensis* Hodgson

Parus Nipalensis Hodgson, 1837, Ind. Rev. 2(1): 31 (Nepal)
Parus major nipalensis Hartert, 1905, Novit. Zool. 12: 499 (South Punjab)
Baker, FBI Nos. 51, 54 and 55 (part), Vol. 1: 74, 77

LOCAL NAMES. *Rān-gengd* (Bengali); *Shadler coolie* (Assam).

SIZE. Sparrow \pm ; length c. 13 cm (5 in.).

FIELD CHARACTERS. As in 1792, q.v.

STATUS, DISTRIBUTION AND HABITAT. Common resident, subject to vertical or local movements. The plains of northern Punjab, Kumaon, Nepal and adjacent plains of Uttar Pradesh and Bihar, Sikkim foothills and the whole of Bengal, Bangladesh and Assam [except for the range of *scutellatus* (1796)] in the plains and lower hills; also Nagaland and Manipur. In the foothills up to c. 1800 m, in Nepal locally to 2700 m. Affects light forest, especially deciduous, forest edges, groves, cultivation and gardens.

Extralimital. Extends east to central Burma. The species ranges from Scandinavia and Morocco east to southeastern Siberia, Japan, China, the Indochinese countries, Borneo and the Sunda Islands.

GENERAL HABITS. As in 1792.

FOOD. As in 1792. Among stomach contents in an intensively cultivated area in Bihar the following insects identified: predominantly weevils (*Mylioxenus discolor*, *Tenymenus* sp. and others); also ants (*Camponotus confusus*, *Oecophylla smaragdina*, *Polyrhachis simplex*), tenebrionid and other caterpillars, pentatomid eggs and hemipteron bugs. Young birds fed chiefly on small caterpillars, young crickets (such as *Brachytrupes achaticus*), mole crickets (*Gryllotalpa africana*), and spiders (Mason & Lefroy, 1912).

VOICE AND CALLS. Song of this subspecies recorded as a loud and clear whistled *chee-chicki, chee-chicki, chee-chicki*, etc. or *weetychi, weetychi, weetychi, weetychi*, repeated 3 or 4 times, followed by a few seconds' pause before resumption. Individual and regional variations in song clearly noticeable (SA). Vocalizations, however, not identical with those of the European (nominate) subspecies, recalling in part those of the latter, in part those of the Coal Tit [*P. ater*] (Dieselhorst).

BREEDING. Season, March to June. Nest and eggs, as in 1792. Average size of 100 eggs 17 \times 13.3 mm (Baker).

TRUE TITS

169

MUSEUM DIAGNOSIS. A wide band of black along shafts of central rectrices; rest of tail grey. Blue fringes of greater coverts broad so that coverts appear blue. White wedge on inner web of second outer rectrix 12-38 mm, usually over 25 mm. Always a black line on outer web of second outer rectrix.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	63-71	11-12	16-17	55-61 mm
♀♀	59-66			53-54 mm (HW, BB)

Weight 8 ♂♂ 12.1-14.5; 4 ♀♀ 12.2-13.7 g (RAP, GD).

COLOURS OF BARE PARTS. As in 1792.

1794. Indian Grey Tit. *Parus major stupae* Koelz

Parus major stupae Koelz, 1939, Proc. Biol. Soc. Washington 52: 61 (Sanchi, Bhopal)
Baker, FBI No. 55 (part), Vol. 1: 77

Plate 95, fig. 18

LOCAL NAMES. *Rāmāchākli* (Gujarati); *Puttani kūrūci* (Tamil).

SIZE. Sparrow ±; length c. 13 cm (5 in.).

FIELD CHARACTERS. As in 1792, q.v.

STATUS, DISTRIBUTION AND HABITAT. Common resident, subject to local movements. Peninsular India from central Rajasthan (Jodhpur, Sambhar Lake) and Gujarat (including the Kathiawar peninsula) east through Madhya Pradesh to Orissa and south through Maharashtra, Karnataka, Andhra Pradesh and Tamil Nadu. Breeds mostly in the hills, spreading to the plains in winter. Affects light deciduous forest, village groves, orchards, etc.

GENERAL HABITS AND FOOD. As in 1792.

VOICE AND CALLS. Song, a musical whistling *witwit-seesee*, *witwit-seesee*, *witwit* or *titiweesi*, *titiweesi*, *titiweesi*, *weesi*, etc. repeated three or four times followed by a break of a few seconds. Kept up more or less throughout the day in the breeding season (SA).

BREEDING. Season, overall February to August, apparently more prolonged in the south where nests have been found in September and even November. Double-brooded. Nest and eggs, as in 1792. Average size of 54 eggs (including *mahrattarum*) 17.5 × 13.6 mm (Baker).

MUSEUM DIAGNOSIS. Differs from *mahrattarum* (1795) in having shorter wing and tail with the outermost rectrices nearly all white. Upperparts brighter and paler, the white edging of tertials much broader. Underparts whiter; black on throat and belly less extensive.

MEASUREMENTS

Parus major tauriei Ripley, 1950, Postilla, Yale Peabody Mus., No. 1: 2
(Chabua, Northeastern Assam)
Baker, FBI No. 51 (part), Vol. 1: 74

LOCAL NAMES. None recorded.

SIZE. Sparrow ±; length c. 13 cm (5 in.).

FIELD CHARACTERS. As in 1792, q.v.

STATUS, DISTRIBUTION AND HABITAT. Common resident. Eastern Assam in Lakhimpur district and the adjacent foothills of the Mishmi and Patkai hills, from the plains to c. 900 m. Affects wet deciduous and sal forest.

GENERAL HABITS, FOOD AND VOICE. As in 1792.

BREEDING. As in 1793.

MUSEUM DIAGNOSIS. Differs from *nipalensis* (1793) in having reduced white patches on second outer rectrices and a darker, smokier wash on flanks. Differs from *decoloratus* by smaller size.

MEASUREMENTS

1 ♂ (type) Wing 59; bill, from skull, 10.5; tail 53.5 mm
White area on second rectrix (on inner web) 9 mm (SDR)
COLOURS OF BARE PARTS. Unrecorded. Probably as in 1792.

1797. Tibet Grey Tit. *Parus major tibetanus* Hartert

Parus major tibetanus Hartert, 1905, Vög. pal. Fauna 1: 346
(Chaksam in Tsangpo Valley, Tibet)
Baker, FBI No. 56, Vol. 1: 78

LOCAL NAME. *Chi-kiaga* (magpie bird—Tibet).

SIZE. Sparrow ±; length c. 13 cm (5 in.).

FIELD CHARACTERS. As in 1792 but upper back greenish.

STATUS, DISTRIBUTION AND HABITAT. Common resident. Southeastern Tibet south to the Chumbi Valley from c. 2900 to 3400 m. Affects poplars, willows and thickets of rose and barberry along the banks of rivers; seldom in conifers or dense forest.

Extralimital. Extends to western Szechuan and northern Yunnan.

GENERAL HABITS, FOOD AND VOICE. As in 1792.

BREEDING. As in 1792. Four eggs measure c. 18.8 × 13.5 mm (Baker).

170

PARINAE

COLOURS OF BARE PARTS. Iris brown. Bill black. Legs, feet and claws slaty; soles dirty pale grey.

Parus major mahrattarum Hartert, 1905, Novit. Zool. 12: 499 (Ceylon)
Baker, FBI No. 55 (part), Vol. 1: 77

LOCAL NAMES. *Marappottan* (Malayalam); *Sittu-kūrūci* (Tamil).

SIZE. Sparrow ±; length c. 13 cm (5 in.).

× c. 1

FIELD CHARACTERS. As in 1792, q.v.

STATUS, DISTRIBUTION AND HABITAT. Common resident. Kerala from the plains to the highest summits; most abundant around c. 1000 m. Sri Lanka in all zones, generally abundant above c. 600 m, less common and more local in the lowlands. Affects scrub and light deciduous forest.

GENERAL HABITS. Keeps in pairs or family parties, either by themselves or in association with other small insectivorous birds. Moves about restlessly among the foliage of trees, hunting for insects. In this quest the birds cling to sprigs and flowering stems in all manner of acrobatic positions, peering under leaves, probing into blossoms and investigating cracks and crannies in the bark. The members keep in touch with one another by lively cheeping and twittering notes.

FOOD. Beetles, moths, caterpillars and other insects, their eggs and larvae; also flower buds, and kernels of various seeds.

VOICE AND CALLS. A chattering and scolding alarm-note. A clear whistling song rendered as *weechichi* and *tisswee* (with other variations). As in 1794 this is repeated 3 or 4 times, then there is a break of 4 or 5 seconds. It continues thus for long periods at a stretch throughout the day, especially in the breeding season (Henry, SA). Call-note, a loud *cheerit*. Alarm-note, a chattering scold. Young solicit food from their parents in a reedy *dee-dee-dee* (Henry).

BREEDING. Season, in Kerala chiefly February to May; nests have also been found in November. In Sri Lanka chiefly in the first half of the year but many birds breed again in September–November. Nest, a pad of moss, fibres, hair, feathers and soft vegetable down; usually placed in holes in trees at moderate heights, sometimes under bungalow eaves. Holes with a small entrance, through which the birds have to squeeze themselves in, are preferred. Eggs, 4 to 6, white or pinkish white, spotted and speckled with reddish brown. Average size of 54 eggs 17.5 × 13.6 mm (Baker). Both sexes partake in the domestic duties. Brooding bird sits very tight, hissing menacingly when fingers inserted into nest-hole.

MUSEUM DIAGNOSIS. Central rectrices black, a line of grey down the outer web. Blue fringes of greater coverts narrow, so that coverts appear black with blue edges. White wedge on inner web of second outer rectrix 16.5 to 34 mm, usually over 25 mm. Sometimes a black line on white outer web of second outer rectrix. Differs from *stupae* (1794) also in being darker; white edging to tertials narrower; bill heavier. Complete postnuptial moult August to November.

172

PARINAE

MUSEUM DIAGNOSIS. Differs from all other subspecies on the Indian list in having the upper back greenish (cf. 1792 Young).

MEASUREMENTS

■ *nuchalis* (1798)

■ *melanolephus* (1802)

■ *aterodius* (1803)

TRUE TITS

173

northwestern India covering Kutch (fairly common but patchily distributed), northern Gujarat (Deesa, Palanpur, Mehsana), central and south central Rajasthan (Pali, Jodhpur, Nasirabad, Ajmer, Kishanganj, Jhalawar and Sambhar). (2) An area in southern India where very rare and recorded only once from each of the following localities: Eastern Ghats west of Nellore, Bangalore, and Satyamangala (Biligirirangan Hills). Affects broken, stony, hummocky semi-desert country where well covered with jungle of be'ool, kandi (*Prosopis*) and pilu (*Salvadora*), and bushes of gugar (*Balsamodendron*), gangi (*Grewia*) and similar species. The occurrence of this species and *P. major* is mutually exclusive.

GENERAL HABITS. Much as in Grey Tit. Met with in pairs or family parties of four or five individuals maintaining contact with one another by clear musical notes. The following observation by Sâlim Ali (JBNHS 52: 785) about roosting birds deserves mention: 'Before I first visited Bhuj [Kutch] in August 1943 my cousin Humayun Abdulali gave me the "address" of one of these tits he had been shown about 6 years previously roosting at night in a particular hole in the cross-bar of a particular gate on the circular road round Bhujia Hill. He asked me half jokingly to try and call on his friend should I have the opportunity. On doing so at sunset on August 8 I was astonished to find the tit (same individual or successor?) at home! When peeped at through a chink, the bird swayed its head and neck deliberately from side to side. In the dim light of the hole the white cheeks and streak down the neck heightened the snake-like effect. Three evenings later I visited the roost again at the same time, caught the bird in its hole and marked it with an aluminium ring. This ringed bird was still in occupation of its roost on April 4, 1944 (i.e. 8 months later). I have no knowledge whether that gate still exists, but it would be interesting to know how much longer this bird continued to sleep there and whether the hole has since been inherited by a successor—for the original occupant can no longer be alive.'

FOOD. Insects, caterpillars, pupae.

VOICE AND CALLS. Contact-notes between members of a party, a rapid clear musical whistling *tee whi whi whi* (or *see pit pit pit*) of the volume and quality of the Tailor Bird's calls. Besides these the usual joyous harsh 'wheeching' notes of the Great Tit are uttered (SA). Another call (or song) is described as a fine bold *whew, whew, whew, whew, whew* uttered rapidly with the last note high (R. M. Adam).

BREEDING. Season, May to August; in Kutch breeding was in full swing in July and August (SA). Nest, a rough pad of soft fibres, wool, cotton and hair (in one case containing a tangle of sewing thread with a needle-attached!); placed in holes in trees about one or two metres above the ground. Eggs, undescribed; clutch size and incubation period unknown. On one occasion three young were seen with their parents. Care of young by both parents.

MUSEUM DIAGNOSIS. See Field Characters. Breeding birds have the underparts suffused with yellow. This colour fades to pure white in museum skins. Complete postnuptial moult in September. Young as adult but black duller (brownish), not glossy.

¹ The gate was dismantled c. 1950.

TRUE TITS

175

Parus monticolus

■ Distributional ranges 1 *monticolus* (1799) 2 Extralimital subspecies

mixed company with small babblers, flycatchers, warblers and suchlike insectivorous birds; once noted in company with *P. major* (JBNHS 54: 629). One of the mainstays of the Himalayan hunting parties. Hunts energetically amongst the foliage of trees, clinging to sprigs sideways or upside down. Occasionally also feeds on the ground though less so than the Grey Tit. Aggressive and agonistic behaviour consists of rapidly bobbing or dipping vehemently, turning excitedly from side to side, flicking wings and tail, as two rivals, a few centimetres apart, approach one another in sidelong hops, facing this way and that, with occasional angry chirrups. Actual physical contact seldom results (SA).

FOOD. Insects, flower buds, fruit and berries.

VOICE AND CALLS. A loud and pleasant whistling song *whitew* (or *whetee*), *whitew, whitew*... repeated four to six times with variations such as *whitew-whitew* etc. (SA). Also a rather musical *pling pling pling* followed by a double note *tee-cup* (SDR). Song period, early February to end May (Proud). Call-note, *teacher* or *sit here* and many other notes rendered as *te-te-where*, *ti-ti-tee-ti*, *whit whit whit*, etc. Calls similar to those of the Grey Tit but louder, clearer and shriller (Schäfer).

BREEDING. Season, March to July. Nest, differs in no way from that of *P. major*, nesting sites and materials being similar. Nests have been found in holes at heights up to 7 m, but are usually under 3 m, in tree-trunks, stumps, posts, roadside parapets, rocky banks as well as in walls and under roofs of houses. Eggs, 4 to 8, generally 5 to 7, differing from those of the Grey Tit in being rounder, more obtuse, and more heavily marked. Average size of 40 eggs 16.7 × 13.1 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters.

(Gangtok, Sikkim)

Baker, FBI No. 59, Vol. 1: 80

Plate 95, fig. 17

LOCAL NAMES. *Chichin kethi* (Paharia); *Sarak-chak-pho* (Lepcha); *Dassi-weti* (Cachari).

SIZE. Sparrow ±; length c. 13 cm (5 in.).

FIELD CHARACTERS. Above, crown and sides of neck black; nuchal patch and cheeks white. Back yellowish olive; rump grey. Wing bluish with two white wing-bars and white tips to tertials. Tail bluish, tip of outer rectrices and outer web of outermost rectrix white. Below, throat and a broad band down the middle of belly black. Rest yellow. Sexes alike.

Very similar in pattern to the Grey Tit but distinguished by olive back, yellow underparts and double wing-bar.

STATUS, DISTRIBUTION AND HABITAT. Resident, subject to vertical movements, locally common. The Himalayas south of the main range from Swat, N.W.F.P. (Paynter, JBNHS 59: 954) eastward through Nepal, Sikkim and Bhutan to Arunachal Pradesh, thence south through Nagaland, Manipur and the Khasi Hills (breeding?). Breeds between 1800 and 2400 m (Murree), 1600-2800 m (Kashmir), 1500-3600 m (from Nepal eastwards), in Sikkim down to 1200 m. Reaches the foothills in winter (October to March) when recorded from Peshawar, the Jhelum portion of the Salt Range (JBNHS 59: 962), the plains of northern Punjab, Dehra Dun, the Jalpaiguri duars and Bhutan foothills; in Nepal not observed below 1200 m but recorded as high as 3900 m in the cold season (BB). Affects many types of forest: light deciduous, oak or deodar, secondary jungle, scrub pastureland, orchards and cultivation. Also dense forest as well as the neighbourhood of populous hill-stations (Murree). On the whole appears to prefer a wetter zone than *P. major*. The two species replace each other altitudinally, *P. monticolus* inhabiting a higher zone, but in the eastern Himalayas occupying an intermediate zone between *P. m. tibetanus* and the lowland subspecies of the Grey Tit (*nipalensis*, 1793).

Extralimital. The species extends to Kansu, Shensi, Hupeh and Vietnam; also Taiwan.

GENERAL HABITS. Keeps in pairs in the breeding season, otherwise in small parties up to 15 or 20 individuals sometimes by themselves, usually in

¹ See also Paynter, R. A., JBNHS 59: 954 for western limit of *yunnanensis*.

176

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. A small, black-crested tit with white cheeks. Above, crown, crest and sides of neck black; cheeks and a nuchal patch white. Back dark grey. Two whitish wing-bars (rows of spots). Below, throat black, rest of underparts fulvous buff. Sexes alike.

Distinguished from *P. rubidiventris* (1804) by double wing-bar, lack of rufous patch on flanks, and fulvous (not slaty) belly. The very similar *P. melanophus* (1802) of extreme western Nepal and westward, also with double wing-bar, is distinguished by rufous flanks and slaty belly.STATUS, DISTRIBUTION and HABITAT. Common resident, subject to vertical movements. The Himalayas from west-central Nepal (Rand & Fleming, 1957) east at least to western Bhutan, and southeastern Tibet (Arunachal Pradesh?). Breeds from c. 2500 m, mostly above 2800 m and up to 3600 m; in eastern Nepal between 3500 and 4200 m (BB, GD). Recorded in winter between 1800 and 3600 m. Affects conifer forest; in Nepal also noted in the *Abies-Betula* facies.

EXTRALIMITAL. Extends to northern Yunnan and Szechuan. The species ranges from Morocco and the British Isles to Kamchatka, Japan and Taiwan.

GENERAL HABITS. Much as in *P. melanophus* (1802). Usually hunts in mixed flocks among the tops of conifers moving from tree to tree in loose follow-my-leader fashion. Observed in company with *P. dichrous*, *P. r. rufonuchalis*, *Certhia familiaris*, *Regulus* and various leaf warblers (*Phylloscopus*). May be seen in parties throughout the summer. A hardy species, often being the only one to enliven the snow-draped coniferous forests in the depth of winter.

PARINAE

1802. **Crested Black Tit.** *Parus melanophus* Vigors*Parus melanophus* Vigors, 1831, Proc. Zool. Soc. London: 23

(Himalayan Mountains = Simla-Almora area)

Baker, FBI No. 63, Vol. 1: 83

Plate 95, fig. 12

LOCAL NAMES. *Pintalön*, *Tajdär tar* (Kashmir).

SIZE. Sparrow —; length c. 11 cm (4 in.).

FIELD CHARACTERS. A small, slaty, black-crested tit. Above, crown, crest and sides of neck black; cheeks and nuchal patch white. Rest of upperparts slaty. Two rusty white wing-bars (or rows of spots). Below, throat and breast black; belly slaty, a rufous patch on flanks. Under tail-coverts rufous. Sexes alike.

The erect black crest, and pure white cheek- and nape-patches give it a distinctive appearance.

The double wing-bar distinguishes it from the very similar *P. rubidiventris* (1804) which, moreover, has the black on underparts more extensive. The Coal Tit (1803), which does not occur within the range of the present species, has a fulvous belly and no rufous on flanks.

STATUS, DISTRIBUTION and HABITAT. Common resident, subject to vertical movements. N.W.F.P. from Safed Koh to Chitral, Gilgit, Astor, Baltistan, Murree and Kashmir eastward through Himachal Pradesh, Garhwal and Kumaon to extreme western Nepal (Fleming & Traylor, 1961; also an old specimen in British Mus.). Breeds from c. 2000 m to timber-line (3300 m in Kashmir, 3600 m in the eastern parts). In winter (October to March) occurs down to the foothills (c. 600 m) but probably does not entirely forsake the higher elevations. Affects oak, coniferous or mixed forest, but shows a preference for conifers — fir, pine and decid.

EXTRALIMITAL. Adjacent parts of northeastern Afghanistan.

GENERAL HABITS. A sociable little tit found in most mixed foraging parties of other tits, goldcrests, leaf warblers, tree creepers, etc.; in winter may gather in flocks of up to 50 individuals. A sprightly bird, hunting restlessly in the high canopy of trees in typical tit fashion, flitting from bough to bough, examining every twig, peering into crevices or pecking at the scales of a fir cone. Occasionally descends to the ground to pick seeds among pine needles and debris.

FOOD. Chiefly insects; also seeds and berries. Frequently comes into hill-station gardens to pick the seeds from ripe sunflower heads.

VOICE and CALLS. Members of a party continually utter their call-notes to keep in touch; most common are *te-leuy* and a thin *zee-zee*; also a plaintive *tyu-tyu* slowly repeated. Song, some short clear whistles rapidly repeated three or four times after short intervals, variously rendered as *uunt you—*, *need you—*, *deed you—*, *kin-ka-jou—*, etc. (Magrath and others).

BREEDING. Season, chiefly May and June, a few birds starting in early April. Nest, mostly made of moss, the cup warmly lined with fur and hair; usually placed in holes in trees within a couple of metres above the ground, occasionally up to ten metres, sometimes in holes in walls of occupied houses or even in the ground. Eggs, 4 to 10, generally 5 or 6, white, with rusty red blotches and specks often forming a zone around the larger end. Average

180

PARINAE

FOOD. Insects.

VOICE and CALLS. The birds keep up a thin cheeping *tsi, tsi* as they search the foliage (SA). Also a call of two notes, the second lower in pitch. Ordinary call-note said to be very different from that of the nominate European subspecies (GD).

BREEDING. Little known. Season, apparently May and June, possibly later (see Diesselhorst, 1968). Nest (one described, FBI 1: 84), a pad of fur in a hole in a tree. Eggs, described as 'indistinguishable from those of the European Coal Tit [white, speckled with reddish brown]; measuring about 17.9 × 12.9 mm' (Baker).

MUSEUM DIAGNOSIS. See Field Characters.

Young. Above, black of adult replaced by dull, dark brown; no crest. Back more olive. Below, throat greyish with an olive tinge. Rest of underparts paler and more yellowish than in adult.

LOCAL NAMES. *Pintalön*, *Tajdär tar* (Kashmir).

SIZE. Sparrow ±; length c. 13 cm (5 in.).

FIELD CHARACTERS. Above, crown, crest and sides of neck black; cheeks white; nuchal patch white tinged rufous near back. Rest of upperparts grey. No wing-bars. Below, throat, breast and upper belly black; lower belly grey. Under tail-coverts and a patch on flanks rufous. Sexes alike.

¹ Jochen Martens, 1971 (JFO 112: 451-8) gives reasons for considering *P. rufonuchalis* and *P. rubidiventris* as distinct species rather than subspecies of the latter.

TRUE TITS

181

Distinguished from the very similar *P. melanoleptus* (1802) by absence of wing-bars and more extensive black of underparts.
STATUS, DISTRIBUTION and HABITAT. Common resident, subject to vertical movements. Pakistan from northern Baluchistan (Ziarat, Loralai) north through N.W.F.P. to Chitral, Gilgit, Astor and Baltistan, thence east through Kashmir to Garhwal and Kumaon (JBNHS 60: 176). Has strayed to west-central Nepal in winter (Rand & Fleming, 1957). Breeds between

Parus rubidiventris

■ Distributional ranges 1 *ruficollis* (1804) 2 *rubidiventris* (1805)
3 *leucotis* (1806) 4 *saronotii* (1806a)

2700 and 3600 m, occasionally descending to c. 1500 m in winter, exceptionally to the foothills (Rawalpindi—A. E. Jones in Bates & Lowther, 1952). Affects fir, pine, mixed oak and spruce forest and, in drier country (such as Baluchistan, N.W.F.P. and north of the main range) also juniper forest or scrub. Also visits thickets of dwarf willows and birch along nullahs.
Extremal. Ranges west to western Afghanistan and north through Turkistan to the Tien Shan.
GENERAL HABITS. Much as in *P. melanoleptus* (1802). One of the commonest tits of high elevations, occurring in most mixed hunting parties. Has regular hammering places on branches to which it takes seeds of drupes and berries to hack out the kernels. See also 1805.
FOOD. Insects and seeds.
VOICE and CALLS. Call-notes, a loud, cheery *gyris-tee, gyris-tee*, a mellow *pit-pip-pit* and some little twittering and reeling notes (HW). Song, a musical double whistle *whi-uh* usually repeated four times, the first syllable short, the second long (SA). Alarm-note, *trrr* similar to that of *P. major*.

TRUE TITS

183

vibrating note, something like the twanging of a low-pitched guitar string (Smythies). Song period mid March to mid June (Proud).
BREEDING. As in 1804.
MUSEUM DIAGNOSIS. Similar to *ruficollis* (1804) above, but grey mantle more weakly tinged with olive; rufous on nuchal patch paler, black of underparts less extensive and belly rufous; it is also smaller.
MEASUREMENTS
Wing ♂♂ 67-71 (av. c. 69) mm — Vaurie
Weight 7 ♂♂ (May-Sept.) 11-13.1; 4 ♀♀ (May-Sept.) 11-12 g — GD.
COLOURS OF BARE PARTS. Iris brown. Bill black. Legs and feet plumbeous.

1806. Sikkim Black Tit. *Parus rubidiventris beccarii* (Jerdon)

LOCAL NAME. *Lho tsao* (Lepcha).
SIZE. Sparrow —; length c. 10 cm (4 in.).
FIELD CHARACTERS. As in 1804, q.v.
Distinguished from *P. ater* (1803) by absence of wing-bars.
STATUS, DISTRIBUTION and HABITAT. Common resident, subject to vertical movements. Eastern Nepal from the Khumbu region (Biswas, JBNHS 60: 176) east through Darjeeling dist., Sikkim, Bhutan and probably Arunachal Pradesh, between 2700 and 4200 m, descending in winter to c. 2200 m. Affects fir, pine and juniper forest as well as rhododendron scrub above timber-line; in winter also in oak forest.
Extremal. Southeastern Tibet, northern Yunnan and north to Tsinghai and Shensi.
GENERAL HABITS, FOOD and VOICE. See 1804 and 1805.
BREEDING. As in 1804.
MUSEUM DIAGNOSIS. Differs from subspecies *ruficollis* (1804) and *rubidiventris* (1805) in lacking the olive tinge on mantle, and having a white nuchal spot; cheeks pale buff rather than white; grey of abdomen washed with rufous.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail

COLOURS OF BARE PARTS. Iris brown. Bill black. Legs and feet brownish plumbeous; claws horny brown.

182

PARINAE

BREEDING. Season, chiefly May and June. Nest, a pad of moss lined with wool and hair; placed deep down in holes, seldom less than c. 30 cm from the entrance, often considerably more. The holes are usually in the ground, in a steep bank, under a large stone or the spreading roots of a tree, sometimes in a cleft or hollow in a trunk or stump within a metre from the ground (*P. melanoleptus* more often chooses a hole in a tree-trunk). Eggs 4 to 6, white, speckled with reddish brown — similar to those of the Grey Tit but rather feebly marked. Average size of 11 eggs 17.6 x 12.9 mm (Baker); of 5 eggs 18 x 13 mm (HW). Both parents feed the young.

MUSEUM DIAGNOSIS. See Field Characters and Key to the Subspecies.
Young, similar to adult in pattern but black replaced by dull sooty. Rufous tinge almost absent from nuchal patch; back and abdomen suffused with olive; axillaries and under tail-coverts pale buff.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	71-78	12-13	19-20	51-56 mm
♀♀	74-75	—	—	—

(HW)

Wing ♂♂ 74-81, average about 76 mm (Vaurie)
Weight 13 ♂♂ 12.3-14.7; 8 ♀♀ 11.4-12.4 g (RAP).
COLOURS OF BARE PARTS. Iris brown. Bill black; mouth fleshy, slaty anterior. Legs and feet plumbeous.

1805. Rufousbellied Crested Tit. *Parus rubidiventris rubidiventris* Blyth
P. (crus) rubidiventris Blyth, 1847, Jour. Asiat. Soc. Bengal 16: 445 (Nepal and Sikkim, restricted to Kathmandu Valley by Ripley, 1961, Synopsis 53)
Baker, FBI No. 65, Vol. 1: 84
Plate 95, fig. 13

LOCAL NAMES. None recorded.
SIZE. Sparrow —; length c. 10 cm (4 in.).
FIELD CHARACTERS. As in 1804 but belly rufous.
STATUS, DISTRIBUTION and HABITAT. Common resident, subject to vertical movements. Tehri Garhwal and Kumaon to east-central Nepal. Has strayed once to Simla. Breeds between 3000 and 4100 m; descends to c. 2400 m in the cold season. Affects pure coniferous forest or mixed conifer and birch; it is also a characteristic bird of the rhododendron zone. For nesting purposes however avoids the treeless scrub zone which it visits in the non-breeding season.
GENERAL HABITS. May be seen in parties of adult individuals throughout the summer, often in company with *P. dictus*, *Agelaeus trichotis*, *delichopsis ignicauda* and leaf warblers; parties are met with oftener than pairs or singles, this posing the question whether the species is territorial or not (GD). Forages mostly among the tree-tops but also descends to bushes.
FOOD. Insects and seeds.
VOICE and CALLS. Among the common utterances of the species (see 1804), also a clear *tü tti*, a rattling *dyä dyä dyä dyä* or *gylllylllyll*... and some fine goldenest-like contact calls (GD); also a most characteristic

SIZE. Sparrow —; length c. 12 cm (4½ in.).

FIELD CHARACTERS. A plain grey and buff crested tit. Above, crown, pointed erect crest, and back brownish grey. A conspicuous whitish collar, interrupted on back. Below, throat greyish fulvous, rest of underparts brownish buff. Sexes alike.

Rather similar in general effect to Yellownaped Yuhina (1368).

STATUS, DISTRIBUTION AND HABITAT. Fairly common resident. The Himalayas from western Nepal east through Arunachal Pradesh, from

TRUE TITS

187

FIELD CHARACTERS. A sprightly black and yellow crested tit. Above, crown, pointed upstanding crest, and a band behind eye black; a few crest-feathers tipped with yellow. A long yellow supercilium joining prominent yellow nape-patch. Back olive-green. Wings black spotted with yellow and black on shoulder, and with a white longitudinal patch. Tertiaries broadly tipped and edged white. Tail blackish slate with white outer edge and white tips. Below, bright yellow with a broad black median band from chin to vent. Sexes practically alike.

The erect black crest, yellow supercilium and spotted wing easily identify this species. For distinction from *spilonotus* see 1812.

STATUS, DISTRIBUTION AND HABITAT. Common resident, subject to vertical movements. The outer Himalayas from Murree east to eastern Nepal (Manebhanjan — Rand & Fleming, 1957). A specimen in British Mus. labelled Darjeeling (Seeborn coll.). Breeds between 1500 and 2100 m, in Nepal up to 2400 m, occasionally descending to 1200 m in winter. Has

straggled to the Salt Range in the cold season. Range disjunct from that of the peninsular races. Affects *ban* oak jungle (*Quercus incana*), *Ilex* and pine forest or subtropical evergreen bush jungle usually with at least a few trees. Also visits gardens, but is more a forest bird than *P. major* and not often seen near houses. Rather capricious in its choice of habitat and may be absent in large tracts of apparently suitable forest.

Extralimital. Species endemic to Pakistan and India. Replaced eastwards by the closely related *P. spilonotus* (1812).

186

PARINAE

2700 m up to timber-line, in eastern Nepal up to 4100 m, descending to 2200 m in winter. Affects chiefly deciduous forest, especially oak, rhododendron and birch, and also mixed fir and rhododendron.

Extralimital. Extends to central Yunnan and western Szechuan. The species ranges north to Tsinghai and Shensi.

GENERAL HABITS. Sociable as other tits; small parties may still be seen in May. Often seen in company with other tits (*P. ater*, *P. rubidiventris*, *Aegithalos*, etc.) and leaf warblers, usually no more than a pair or so in every hunting party. Keeps to low or moderate heights in bushes and trees; also feeds on the ground.

FOOD. Chiefly insects.

VOICE AND CALLS. A characteristic, thin and high-pitched call-note rendered as *zai*; also some goldcrest-like contact-calls (GD). Voice quite unlike that of the European *P. cristatus* (GD, MD).

BREEDING. As in 1807.

MUSEUM DIAGNOSIS. Darker than *kangrae*. Postnuptial moult complete in July and August.

Young differs from adult in the shorter crest, the tips of which are darker than the rest of the feathers. Upperparts darker; underparts paler and less uniform cinnamon-buff.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail

Baker, FBI No. 75, Vol. 1: 91

LOCAL NAMES. None recorded.

SIZE. Sparrow ±; length c. 14 cm (5½ in.).

188

PARINAE

GENERAL HABITS. Similar to other tits, foraging in mixed parties in the non-breeding season, but also reported to be less gregarious than other tits, being oftener seen solitary or in pairs.

FOOD. Insects and some vegetable matter; mulberries, raspberries, etc.; spiders.

VOICE AND CALLS. Calls very distinct from those of other tits. When in parties, a contact note like *tyuji*, *tyuja* is uttered; when approaching nest, a loud *towit*, *towit*; also a chattering alarm-note. Song rendered as *teeteeen towt-teeteeen* (Magrath); also a clear whistling *wicheewee-wicheewee-wichi*, repeated two or three times (SA). Song period January to September, chiefly March-April (Proud).

BREEDING. Season, March to June. Nest, a pad of moss with a central cup lined with fur; almost always in holes in trees, from ground level up to about six metres; occasionally between roof and ceiling of hill-station bungalows. Eggs, 4 or 5, similar to those of *P. major* but the markings fewer and finer. Average size of 40 eggs 17.9 × 13.2 mm (Baker). Building, incubation and care of young by both sexes. Incubation period undetermined.

MUSEUM DIAGNOSIS. See Field Characters and Key to the Subspecies. *P. spilonotus* (1812) is distinguished by black streaks on back, and yellow forehead.

Female has a shorter crest and slightly narrower ventral band. Postnuptial moult complete. Moulting period apparently very extended, individuals being still in moult towards the end of October.

Young similar to adult but crest shorter, white on tertiaries washed with yellow, black of lower parts duller and narrower.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail

Weight 11 ♂♂ 13.7-16.9; 9 ♀♀ 12.9-15.9 g (RAP, GD).

COLOURS OF BARE PARTS. Iris dark brown. Bill black, sometimes horny on tip. Legs, feet and claws bluish slaty.

1810. Central India Yellowcheeked Tit. *Parus xanthogenys eplonotus* Blyth

P. (erus) eplonotus Blyth, 1847, Jour. Asiat. Soc. Bengal 16: 444 (Mountains of central India, restricted to Chaibasa, Singhbhum, Bihar, by Whistler & Kinnear, 1932, Jour. Bombay nat. Hist. Soc. 35: 519-21)

Baker, FBI No. 76 (part), Vol. 1: 92

LOCAL NAMES. None recorded.

SIZE. Sparrow ±; length c. 14 cm (5½ in.).

FIELD CHARACTERS. Male practically as in 1809; spots on wing white. Female has the ventral median band greyish olive instead of black.

STATUS, DISTRIBUTION AND HABITAT. Widespread and fairly common resident in the Peninsula, chiefly on the elevated plateau and hills, uncommon or absent in the coastal plains. Eastern Gujarat, southern Rajasthan

TRUE TITS

189

(Mt Abu, Jhalawar), the whole of Madhya Pradesh (including Gwalior), southern Bihar, Orissa, south in the Eastern Ghats to the Krishna river and in the Western Ghats to Mahabaleshwar. Affects well-wooded country, generally more so than *P. major*.

GENERAL HABITS. Like other tits forages in small parties or pairs most often in company with other small insectivorous species such as white-eyes, nuthatches and leaf warblers. Prefers the leafy canopy of trees but will descend lower on occasion. Searches energetically for insects among the crevices of the bark, hopping about and peering under the leaves, clinging to sprigs sideways or upside down and in all manner of acrobatic positions.

FOOD. Insects, grubs, ants, spiders, fruit and berries.

VOICE AND CALLS. Members of a party keep up a joyous *chee chee* while hunting for food. Song, a clear whistling *cheewit-pretty-cheewit* (and variations) uttered with crest erect and wings drooping at the sides, while moving through the branches; notes more musical than of most other tits (SA).

BREEDING. Season, April to August, in the south apparently beginning later and lasting till October. Nest and eggs as in 1809. Average size of 60 eggs (including those of *travancorensis*) 17.9 × 13.5 mm (Baker).

MUSEUM DIAGNOSIS. Like *xanthogenys* (1809) but upperparts duller olive-green. Yellow of ear-coverts and sides of neck paler. Greater and median wing-coverts tipped with white instead of yellow. In the female, median band on underparts olive instead of black.

Young resemble their respective adults. Black markings less glossy. White tips of greater and median coverts washed with yellow. Rectrices narrower, with the white tips smaller and less pure white. A complete postjuvinal moult.

MEASUREMENTS

Baker, FBI No. 76 (part), Vol. 1: 92

Plate 95, fig. 22

LOCAL NAME. *Pacha-marapottam* (Malayalam).

SIZE. Sparrow ±; length c. 14 cm (5½ in.).

FIELD CHARACTERS. As in 1810. Female sometimes with crown and crest olive instead of black, in addition to the ventral band.

STATUS, DISTRIBUTION AND HABITAT. Common resident. The Sahyadris or Western Ghats from southwestern Maharashtra (South Konkan) south

TRUE TITS

191

SIZE. Sparrow ±; length c. 14 cm (5½ in.).

FIELD CHARACTERS. As in 1809, q.v., but forehead and lores yellow. Back streaked with black.

STATUS, DISTRIBUTION AND HABITAT. Resident, subject to vertical movements, scarce and locally distributed. Extreme eastern Nepal in the Mai Valley (Stevens, JBNHS 29: 725; Fleming & Traylor, 1964, *Feldiana* 35: 548), Darjeeling dist., Sikkim, Bhutan and Arunachal Pradesh to the Mishmi Hills (Ali & Ripley, 1948). Noted in summer between 1600 and 2400 m, in winter down to 1400 m and, exceptionally, at 3700 m (Meinertzhagen). Affects light, mixed forest and neighbourhood of cultivation.

Extralimital. Northern Burma.

GENERAL HABITS, FOOD AND VOICE. As in 1812a.

BREEDING. As in 1812a.

MUSEUM DIAGNOSIS. For distinction from Yellowcheeked Tit (1809) see Field Characters. Reasons for keeping it specifically distinct from *P. xanthogenys* are discussed by Paynter, loc. cit. *supra*. The two species do not appear to intergrade. For distinction from subspecies *subiridis* see 1812a, under Museum Diagnosis.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	71-84	c. 11	c. 18	58-63 mm
				(Mayr, MD)

Weight 2 ♂♂ 18.3, 19.4 g (RAP).

COLOURS OF BARE PARTS. Iris brown. Bill dark plumbeous horny. Legs and feet bluish plumbeous.

1812a. **Burmese Blackspotted Yellow Tit.** *Parus spilonotus subiridis* Blyth

Parus subiridis Blyth (ex Tickell MS.), 1855, Jour. Asiat. Soc. Bengal 24: 267 (Tenasserim)

Baker, FBI No. 74, Vol. 1: 91

LOCAL NAMES. None recorded.

SIZE. Sparrow ±; length c. 14 cm (5½ in.).

FIELD CHARACTERS. As in 1812, q.v.

STATUS, DISTRIBUTION AND HABITAT. Resident, locally common. Nagaland, Manipur and in the Cachar, Khasi and Mizo hills. Breeds above 1500 m. Affects light forest of oak, pine, rhododendron and other evergreens.

Extralimital. The Chin Hills south to Mt Victoria, northern Burma to northern Yunnan and northern Thailand. The species extends to Vietnam and through southern China to Fukien.

GENERAL HABITS. Keeps in pairs or small parties, usually in mixed company. Frequents the higher trees but also descends to bushes. Not so restless as *P. major* but still active, energetic and assuming the same acrobatic attitudes while hunting for food amongst the foliage.

FOOD. Chiefly insects; also berries and some vegetable matter.

VOICE AND CALLS. Song, a loud and spirited whistling syllabified as *did-he-do-it did-he-do-it no-he-didn't* (Baker), usually uttered from the tops of trees.

190

PARINAE

through western Karnataka (Malnaad), Kerala and western Tamil Nadu, between 900 and 1500 m; in the Nilgiris occupies a lower zone than *P. major* which is found mostly above 1800 m (Jerdon). Affects evergreen biotope — open forest, mixed bamboo jungle, cardamom sholas, coffee plantations, etc.

GENERAL HABITS. As in 1809. The itinerant foraging parties of which the Yellowcheeked Tit is a regular member are commonly composed, among others, of *Sitta frontalis*, *Callicapra ceylonensis*, *Alcippe poioicephala*, *Argitta liphia*, *Pyronotus ictericus*, *Hemipus picatus*, *Tephrodornis gularis*, *Pericrocotus flammeus*, *Phylloscopus occipitalis* and *P. nitidus*.

FOOD. Insects: cockroaches, grubs, caterpillars; insects' eggs, spiders, berries (*Rubus*), etc. Flying ants occasionally taken in air. Frequently visits the flowers of *Salmalia* trees for nectar. See also 1810.

VOICE AND CALLS. As in 1810.

BREEDING. Season, June to October. Nest and eggs as in 1809.

MUSEUM DIAGNOSIS. Like *aplonotus* (1810) but upperparts duller, more saturated green. Yellow of underparts duller and more washed with olive-green. White tips to rectrices smaller. Size slightly larger.

Female apparently polymorphic. Phase (a) similar to male with crown, eye-streak and ventral band black. (b) Similar to male with crown and eye-streak black but ventral band dull olive-green. (c) Similar to male but crown and crest dull greenish olive with darker centres and shafts; eye-streak and ventral band dull greenish olive, hardly darker than the rest of underparts (HW).

Young. Male has crown and ventral band black, whereas female has the crown black and the ventral band dull olive-green. Young female not polymorphic but black crown can be followed by greenish olive crown of adult form (c).

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	71-82	12-14	19-20	54-62 mm
♀♀	68-76			51-57 mm
				(HW, SA, Koelz)

COLOURS OF BARE PARTS. Iris brown. Bill ♂ horny black, ♀ horny brown; mouth pink. Legs and feet bluish grey. Juvenile, gape yellow; commissure and tip of lower mandible whitish; mouth yellowish pink; rest as in adult.

PARUS SPILONOTUS Bonaparte

Key to the Subspecies

Male greyer, less yellow on flanks; female with dull olive-yellow ventral band *P. s. subiridis*

Male brighter yellow on flanks; female with black ventral band *P. s. spilonotus*

LOCAL NAME. *Muchetink pho* (Lepcha).

192

PARINAE

BREEDING. Season, end of March to end of June. Nest, a pad of moss, chips of bracken leaves, fur, hair or wool, usually placed in holes in trees; in stone walls only when tree-holes are wanting. Eggs, 4 to 6, rarely 7, similar to those of *P. major* (1792) — white speckled with reddish brown — but larger and more boldly blotched. Average size of 60 eggs 17.6 × 14.1 mm (Baker).

MUSEUM DIAGNOSIS. Male similar to *spilonotus* (1812) but greyer, less yellow on flanks. Black edge of feathers of upperparts more extensive.

Female has black of underparts (median stripe) replaced by dull olive-yellow, just darker than the rest of the underparts. Mantle less marked with black than in female *spilonotus*.

Young. Above, crown dull black; back duller and black parts not sharply defined. Edges of tertials greenish white instead of bluish white. Black on coverts replaced by brown and the spots creamy white. Below, black portions duller and browner; rest of underparts dirty cream yellow.

MEASUREMENTS

SIZE. Sparrow —; length c. 9 cm (3½ in.).

TRUE TITS

193

194

PARINAE

FIELD CHARACTERS. As in 1814, q.v.

STATUS, DISTRIBUTION and HABITAT. Resident, subject to vertical movements, locally common. The western Himalayas from Ladakh (Leh) and western Kashmir (Srinagar and Pir Panjal) east to Kumaon (Vaurie, 1965). Altitudinal distribution imperfectly known. Recorded in summer at c. 2100 m (northern slopes of Pir Panjal) and from 3000 to 3600 m (Ladakh). Very uncommon in winter (October to March) between c. 1200 and at least 2400 m from Kashmir to Simla. In summer noted to frequent willows (Ladakh) and apricot orchards (Sutlej Valley). In the cold season observed in oak forest, deciduous jungle and gardens.

GENERAL HABITS, FOOD and VOICE. As in 1814.

BREEDING. Unknown.

MUSEUM DIAGNOSIS. Like *modestus* (1814) but paler and brighter, more yellowish, above and below.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
1 ♂	57	18	16	35 mm (HW)

COLOURS OF BARE PARTS. Iris dark brown. Bill, legs and feet plumbeous.

1814. Eastern Yellowbrowed Tit. *Sylviparus modestus modestus* Burton

Sylviparus modestus Burton, 1836 (1835), Proc. Zool. Soc. London: 154 (*apud* Montes Himalayensis = Nepal *vide* Baker, 1920, Handlist: 8)

Sylviparus saturator Rippon, 1906, Bull. Brit. Orn. Cl. 16: 87 (Mt Victoria) Baker, FBI No. 70, Vol. 1: 88

Plate 95, fig. 21

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 9 cm (3½ in.).

FIELD CHARACTERS. A small olive-green bird easily mistaken for a leaf warbler. Above, olive-green with a pale eye-ring. A short tuft-like crest often raised. A short, bright yellow supercilium but not always visible in the field; more clearly seen when the diminutive crest is erected in agitation or courtship. Below, paler, olive-buff. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Fairly common resident, subject to vertical movements. The Himalayas from Nepal east through Arunachal Pradesh (Ludlow, *Ibis* 1944: 68), thence south through Nagaland, Manipur and Cachar (eastern Barail Range). Recorded in summer between 2100 m (Lhalung — Ludlow) and 3200 m (Bigu — GD), in autumn up to 4200 m (central Nepal — Smythies). In winter, noted between 1500 and 2900 m. In summer affects fairly open oak and rhododendron forest, mixed deciduous and conifer forest, mossy broad-leaved forest, and scrub near timberline. In winter, noted in heavy rhododendron and evergreen jungle, and bushes on hillsides.

Extralimital. The Chin Hills of Burma, southeastern Tibet (south of the main range) and east through Szechuan and Yunnan to northern Vietnam; also the mountains of Fukien. Another subspecies (*klossi*) in Vietnam.

13

PENDULINE TITMICE

195

entrance slit. Eggs, 4–6, white without noticeable marking; unmeasured as broken in removal. A male shot on 5 April (Bhutan) had fully mature gonads (8 × 5 mm) and was evidently breeding (SA). Not yet fully fledged young recorded on 11 May.

MUSEUM DIAGNOSIS. Differs from *simlaensis* in being darker and duller, less yellowish.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	57–64	8–9	15–17	35–41 mm
♀♀	54–62			33–39 mm

(BB, Stres., SA, Stevens, NBK)

Weight 8 ♂♂ 6.1–8.5; 6 ♀♀ 6.2–7.8 g (RAP, GD). 3 ♂♂ (Feb.–Mar.) 6–7; 4 ♀♀ (Feb.–Mar.) 6–7 g (SA, BB).

COLOURS OF BARE PARTS. Iris dark brown. Bill: upper mandible dark horny, bluish slaty on base and greyish white on the sides of its anterior half; lower mandible bluish slaty with a dark tip. Legs, feet and claws bluish slaty.

Subfamily REMIZINAE: Penduline Titmice

Baker, FBI No. 949 (part), Vol. 2: 545

Plate 95, fig. 6

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 9 cm (3½ in.).

FIELD CHARACTERS. A dumpy short-tailed bird, reminiscent of a flower-pecker.

Male (summer). Above, forecrown bright orange-scarlet. Rest of upperparts yellowish olive. Wings brown with two yellow wing-bars, the lower broader and more prominent. Below, chin and throat bright orange-scarlet paling to saffron yellow on breast and pale yellow on belly.

Winter plumage duller: no orange on crown, which is yellowish olive; underparts yellowish white with a yellower tinge on throat and breast.

Sylviparus modestus

Distributional ranges

■ *simlaensis* (1813)

▨ *modestus* (1814)

GENERAL HABITS. Quiet and unobtrusive. Usually found in the mixed hunting parties of Redheaded and Greenbacked tits, sivas, yuhinas, creepers, goldcrests and leaf warblers, from the last of which it is difficult to distinguish. In summer oftener met with singly or in small parties of its own. Frequents the tops and foliage canopy of trees as well as bushes, moving about busily, clinging to leaves and sprigs in acrobatic positions like a tit, or flitting restlessly among the foliage, nervously flicking its wings like a leaf warbler (SA). 'In appearance and habits very like a *Phylloscopus*' (Proud). '... indeed I procured my first specimen under the impression that I was shooting a willow warbler, though once known it may be identified with fair certainty' (HW).

FOOD. Insects, ants, grubs, caterpillars and occasionally some vegetable matter. On one occasion 'seemed to feed almost entirely on the pupae of the *Tortrix* moth or something similar which are found in the curled-up leaves' (Proud).

VOICE and CALLS. Call-notes, a weak, very high-pitched *pit* or buzzy *tzee*, *tzee* (Fleming) and a curious grating *churr* (Smythies). 'The note very much resembles that of the British Blue Tit' (A. E. Jones). Song, a thin shrill *zee-zee-zee-zee* uttered endlessly in April (Proud); a high squeaking *tee* repeated 5–8 times in a 5-second period (Fleming). Song period early March to end of May.

BREEDING. Unknown until recently described from Central Nepal, c. 2400 m (R. L. Fleming, Jr., 1973, JBNHS 70 (2)). Season, April–May. Nest, a thick pad of squirrel fur and brown moss in a tree-hole (rhododendron, maple) between half and 6 metres from ground, with narrow vertical

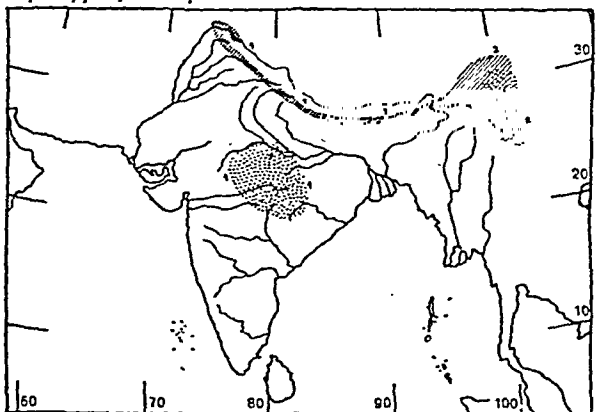

196

REMIZINAE

Female. Above, olive, yellow on forehead and yellowish on rump. A broad yellow wing-bar. Below, pale yellowish olive, centre of belly cream-buff. Winter plumage duller; no yellow on forehead.

Male in breeding plumage unmistakable. Otherwise very similar to *Sylviparus* but distinguished by yellow on wing.

STATUS, DISTRIBUTION and HABITAT. Summer visitor to the western Himalayas, locally common. Gilgit, Baltistan, Ladakh and the Rawalpindi dist. (Murree) east to Garhwal (Dehra Dun). Breeds between 2000 and 3300 m; in Kashmir observed as high as 3500 m in dwarf willows. Affects

Cephalopyrus flammeiceps

Distributional ranges

▨ Breeding

■ Winter

1 *flammeiceps* (1815) 2 *olivaceus* (1816)

poplars, willows, oak forest, orchards, mixed forest of hazel, elm and walnut just below the silver fir zone, wooded hillsides or dense jungle. Winters in central India from Etawah and Kanpur to Raipur, Nagpur and Schore. Observed once in Ambala in December; 2 specimens collected in Bharatpur, E. Rajasthan, in January (SA).

Extralimital. Has strayed once to Afghanistan.

MIGRATION. Arrives on breeding grounds in April. Passage in the foothills mostly in the second half of March and early April, unnoticed in autumn. Recorded in winter quarters from the middle of October to March, once as late as 15 May.

GENERAL HABITS. In the non-breeding season keeps in small hunting parties, usually of its own, sometimes in company with various leaf warblers. On migration larger parties of up to 20 or 30 birds may be met with. Flits

PENDULINE TITMICE

197

restlessly about the tops of trees, working the blossoms, catkins or old seed-cases after the manner of redpolls or tits, clinging upside down and sideways to the extremity of small twigs to examine the foliage. Flicks wings nervously like a leaf warbler. Movements and habits very similar to those of leaf warblers and also of *Sylviparus*, *Dicaeum* and *Zosterops*.

FOOD. Chiefly insects, also leaf- and flower-buds. Has been observed eating the exudation from petioles of banyan leaves.

VOICE AND CALLS. Song described as a faint twittering reminiscent of that of *Zosterops* but more sustained; also like a feeble version of song of Goldfronted Serin (*Serinus pusillus*) — HW.

BREEDING. Season, early April to June. Nest, a mere pad of fine strips of dry grass, sometimes mixed with a few soft feathers; placed in a hole in a tree-trunk or branch, from near the ground up to 15 metres or so, generally between 6 and 12 metres. Eggs, normally 4, pale blue-green, unmarked. Average size of 40 eggs 14.6 × 11 mm (Baker). Building of nest by female, invariably escorted by singing male. Period, and share in incubation, unrecorded. Feeding of young by both parents, sanitation apparently by female alone. Female sits very close, and if disturbed 'puffs' or hisses at the intruder after the manner of tits (Jones).

MUSEUM DIAGNOSIS. For distinction from *olivaceus* see 1816.

YOUNG. Upperparts dull olive tinged with brown. Bar on median coverts dull yellowish, less distinct than in adult. Underparts sullied white irregularly tinged with yellow. Postjuvénal moult of body-feathers and at least some coverts.

Adult undergoes a moult of body-feathers in February. Postnuptial moult complete. Adult in fresh winter plumage at end of August.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂ ♀	58-64	9-10	13-15	30-33 mm (SA, MD)

COLOURS OF RARE PARTS. Iris brown. Bill brownish plumbeous. Legs and feet plumbeous.

1816. Eastern Firecapped Tit. *Cephalopyrus flammiceps olivaceus* Rothschild

Cephalopyrus flammiceps olivaceus Rothschild, 1923, Novit. Zool. 30: 263
(Vicinity of Tengyueh)

Cephalopyrus flammiceps saturatus Whistler, 1924, Bull. Brit. Orn. Cl. 45: 15
(Sikkim)

Baker, FBI No. 949 (part), Vol. 1: 545

LOCAL NAMES. None recorded.

SIZE. Sparrow — ; length c. 9 cm (3½ in.).

FIELD CHARACTERS. As in 1815, q.v.

STATUS, DISTRIBUTION AND HABITAT. Very little recorded. Apparently rare and very locally distributed. Known only from specimens taken in winter in Sikkim and Bhutan between 300 and 2300 m, and in the Jalpaiguri and Buxa duars. One specimen from E. Nepal in British Museum.

LONGTAILED TITMICE

199

c. 4900 m), where obtained on 1 June with testes much swollen. 'It is more than likely that they were breeding in the abundant thick scrub in the dry river-bed' (Meinertzhagen, *Ibis* 1927: 415). Affects tamarisk-acacia scrub jungle along rivers; and sheesham trees (*Dalbergia*) along canal banks and in forest plantations. During migration may occur in gardens, orchards or bushes on hillsides.

EXTRALIMITAL. Extends north through Turkestan to the Sayans and the upper Yenisey. The species ranges west to Spain and east through southern Siberia to Amurland and northern China.

MIGRATION. A short-range migrant. Within our limits migrates through N.W.F.P. (Peshawar, Kohat) in the second half of March and first week of April. Autumn passage unnoted. Recorded in winter quarters from September (earliest 19 Sept.) to March (latest 20 March).

GENERAL HABITS. In winter usually seen in parties of from 2 to 40 individuals, sometimes in company with white-eyes. Hunts in the foliage of trees and bushes, clinging upside down and sideways to the leaf clusters and sprigs in the typical manner of tits.

FOOD. Small insects and their larvae.

VOICE AND CALLS. A mousy cheeping note constantly uttered as it moves about — *see-see* etc. (SA), resembling that of *Dumetia* or *Zosterops*.

BREEDING. Season, end of May and June. Nest, a pouch-shaped pendant structure of very soft vegetable down intricately woven, or felted, with a protruding, spout-like entrance near the top; generally hung from the end of a branch, often over water, at heights of one to five metres or so. For details see Dementiev. Eggs 5 to 9, white, unmarked.

MUSEUM DIAGNOSIS. See Field Characters.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂ ♂	50-54	10-11	13	40-44 mm
♀ ♀	52-54			39-43 mm (HW, MD)

COLOURS OF RARE PARTS. Iris brown. Bill dark brown with pale-coloured edges. Legs and feet dark slate.

Subfamily AEGITHALINAE: Longtailed Titmice

For description see *A New Dictionary of Birds*, 1964, p. 823

Genus AEGITHALOS Hermann

Aegithalos Hermann, 1804, Obs. Zool.: 214. Type, by monotypy,

Pipra? europaea Hermann = *Parus caudatus* Linnaeus

Aegithaliscus Cabanis, 1851, Mus. Hein. 1: 90. Type, by original designation,

Parus erythrocephalus Vigors = *Psittacus concinnus* Gould

Bill very short and stout; culmen strongly curved; nostrils hidden by small feathers. First primary (as.) well developed but shorter than half the length of second. Tail longer than wing, much graduated. Plumage very soft.

198

REMIZINAE

EXTRALIMITAL. Recorded from northern Yunnan, northern Szechuan and southeastern Tibet (Ludlow, *Ibis* 1944: 205).

GENERAL HABITS, FOOD AND VOICE. As in 1815.

BREEDING. Unrecorded. Two males collected in Bhutan (at c. 2300 m) 7 and 9 March had mature gonads, evidently ready to breed (SA).

MUSEUM DIAGNOSIS. Upperparts darker, more olive-green than in nominate *flammiceps* (1815). Orange patch on forehead of male smaller; orange of underparts more reduced and breast more greenish, less yellowish. Female also more greenish on breast.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
2 ♂ ♂	59, 60	10, 10	15, 16	32, 35 mm (SA)

Weight 2 ♂ ♂ 7, 7 g (SA).

COLOURS OF RARE PARTS. Iris dark brown; eye-rim plumbeous. Bill, legs and feet plumbeous-slate; mouth yellow, plumbeous anteriorly.

Genus REMIZ Jarocki

Remiz Jarocki, 1819, Spis. Ptaków Król. Warszawa: 21. Type, by subsequent designation, *Parus pendulinus* Cuvier = *Motacilla Pendulinus* Linnaeus

Cf. Dementiev, G. P., 1935, *L'Oiseau*: 82-5.

Vaurie, C., 1957, *Amer. Mus. Novit.*, No. 1833: 4-6.

Genus characters similar to those of *Cephalopyrus*; differs mainly in building a hanging nest.

1817. Penduline Tit. *Remiz pendulinus coronatus* (Severtzov)

Aegithalus coronatus Severtzov, 1872, Vertik. Turkest. Zhivotn.: 136, pl. 9, fig. 3
(Khodzhen, Turkestan)

Baker, FBI No. 86, Vol. 1: 100

Plate 95, fig. 7

LOCAL NAMES. None recorded.

SIZE. Sparrow — ; length c. 10 cm (4 in.).

FIELD CHARACTERS. A small buffish tit with a conspicuous blackish band through eye and round the crown. Above, crown whitish. Forehead, a broad band through eye, ear-coverts and around nape brownish black; this nuchal band very variable in extent, sometimes covering most of the crown. Upper back whitish followed by a transverse chestnut band. Rest of back clay-colour. A dark chestnut patch on wing with a buff lower edge. Flight-feathers and rectrices broadly edged with white. Below, throat white continued as a collar on sides of neck and upper back. Rest of underparts cream-buff suffused with dark rufous on breast and flanks. Female similar but nuchal band narrower.

STATUS, DISTRIBUTION AND HABITAT. Winter visitor in small numbers to the plains of the Indus east to Lahore, Bahawalnagar, Bahawalpur (Punjab), and south to Sukkur in Sind. A possible breeder in Ladakh (Changchenmo,

SIZE. Sparrow — ; length c. 10 cm (4 in.).

FIELD CHARACTERS. Above, crown rufous-chestnut; supercilium white; lores to ear-coverts black; eye yellowish white. Back grey; wings brown with a darker shoulder-patch. Tail brown with white outer edge and tips. Below, chin and sides of throat white; centre of throat black. Rest of underparts ochraceous buff. Sexes alike. Young birds have white throat.

STATUS, DISTRIBUTION AND HABITAT. Common resident, little seasonal movements. Pakistan in N. Baluchistan (Ziarat) and N.W.F.P. (Peshawar, and presumably the intervening ranges), thence east along the outer Himalayas through the Murree hills, the Jhelum Valley (but not in the Valley of Kashmir), Kishtwar, Jammu (?), and Himachal Pradesh (Chamba and Kulu) to western Nepal (Fleming & Traylor, 1961; Rand & Fleming, 1957) grading into *rubricapillus* in Nepal. Breeds between 1400 and 2400 m wandering in winter down to 900 m or up to 2900 m. Affects bushes and trees in open forest, especially oak woods. Also visits gardens. Near Ziarat frequents juniper forest.

GENERAL HABITS. Very sociable, restless and fussy; invariably found in flocks, often associated with *Zosterops*, leaf warblers, tree creepers, and other tits. Frequents bushes as well as the canopy of trees, actively investigating leaves and twigs, hanging upside down or clinging sideways, seldom remaining still for a second and 'flying on' rapidly in straggly follow-my-leader fashion from tree to tree. Very confiding, often ignoring the presence of an observer. Breeding birds pair off in March but parties may be seen throughout the nesting season. Unlike tits of the genus *Parus* which often roost in

LONGTAILED TITMICE

201

Aegithalos concinnus

Distributional ranges

■ *iredalei* (1818) ■ *rubricapillus* (1819)
 ■ *manipurensis* (1820) ■ Extralimital spp.

holes, this species favours a sheltered branch in a bush, along which birds huddle together in the manner of parrotbills or munias.

FOOD. Chiefly insects; also tiny seeds and fruits. Particularly fond of wild raspberries (*Rubus*).

VOICE AND CALLS. Call-notes, a soft *trr-trr-trr* or *tz-tz-tz* continually uttered while foraging; also some little, almost bell-like notes. Alarm-note a rustling *prrr-prrr* usually taken up by every member of the party.

BREEDING. Season, end of March to May, occasionally June. Single-brooded. Nest, a small upright oval structure very like that of the Long-tailed Tit (*A. caudatus*), about 10 to 15 cm in its long axis, with the entrance on the side near the top; made of green moss mixed with lichen, rootlets, scraps of bark and vegetable down, all bound together with cobweb, especially cocoons, perfectly camouflaged in its surroundings. It is densely lined with feathers and suspended between several twigs or wedged into a fork, usually in a low bush or stunted oak within easy hand reach; occasionally higher: once built in a clump of fir cones some 12 metres up in the tree. Eggs, 3 to 8, generally 4 to 6, white to pale lilac-white, with tiny pinkish red freckles disposed in a dense ring around the larger end, sparse elsewhere. Unmarked eggs have been found. Average size of 100 eggs 13.9 × 10.6 mm (Baker). Share of the sexes in the nesting duties, and incubation period, unrecorded.

MUSEUM DIAGNOSIS. See Field Characters. Differs from *rubricapillus* (1819) in being larger (cf. weight), and in having the back greyer and the crown paler.

LONGTAILED TITMICE

203.

STATUS, DISTRIBUTION and HABITAT. Resident, locally common. Nagaland, Manipur, and in the Cachar, Khasi and Mizo hills. Breeds above c. 1500 m. Affects bushes in mixed or pine forest, and secondary growth.

Extralimital. The Chin Hills of Burma.

GENERAL HABITS, FOOD and VOICE. As in 1818.

BREEDING. As in 1818. Average size of 19 eggs 13.1 × 10.4 mm (Baker).

MUSEUM DIAGNOSIS. Differs from *rubricapillus* in having the supercilium mixed black and white (i.e. pure white) and the abdomen darker, separated from black of throat by a white band.

MEASUREMENTS. As in 1819, perhaps a little smaller. Wing 2 ♂♂ 48, 49 mm (Stres.).

Weight 2 ♂♂ 5.5, 7; 1 ♀ 5.5 g (SDR).

COLOURS OF BARE PARTS. As in 1818.

1821. Whitecheeked Tit. *Aegithalos leucogenys* (Moore)

Orius leucogenys Moore, 1854, in Horsfield & Moore, Cat. Bds. Mus. E.I. Co. 1:

374 ('woods above Balu Chughur' = Bharawal above Bala Chaugra Serai, northeast Afghanistan, ride Whistler, 1944, JBNHS 44: 516)

Baker, FBI No. 83, Vol. 1: 97

Plate 95, fig. 1

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. Above, crown fulvous brown. A broad black band from lores and around eye to nape. Eye pale straw colour. Back olive-grey. Wings brown, darker at shoulder. Tail brown with white outer edge. Below, sides of throat and cheeks white; chin and centre of throat ('bib') black. Rest of underparts pale cinnamon-buff. Sexes alike.

Distinguished from *A. concinnus* by absence of white supercilium.

STATUS, DISTRIBUTION and HABITAT. Imperfectly known. Resident, subject to vertical movements; locally abundant. Pakistan from Chitral south to Ziarat (N. Baluchistan) and east through Gilgit and Baltistan to the Sind Valley (Kashmir); in N.W.F.P. east to Attock. Breeds between 1600 and 2600 m, in Chitral up to 3600 m (Fulton, JBNHS 16: 46). In winter descends locally to 450 m (Attock). Affects bushes in forest, ilex scrub, tamarisk bushes along rivers (N.W.F.P.) and juniper forest (Ziarat).

Extralimital. Adjacent parts of eastern Afghanistan.

GENERAL HABITS. Those of the genus (cf. 1818). Keeps in parties of 6 to 12 individuals, usually in company with other tits and creepers etc. moving from tree to tree.

FOOD. Chiefly insects and their eggs and larvae.

VOICE AND CALLS. Call-note *prir-t-t* continually uttered while foraging (Whitehead). Also *ut*, *it* and a weak churring alarm-note (Paludan).

BREEDING. Season, end of March to May. Nest, an upright oval ball measuring about 11 by 8 cm, with a lateral entrance-hole towards the top; made of moss and grass leaves bound with cobweb and densely lined with feathers; usually placed near the top of an oak bush between one and three metres or so above the ground. Eggs, 5 to 8, white, sometimes with a faint zone of pinkish red spots round the large end; they measure about 14.7 × 9.9 mm (Whitehead).

202

AEGITHALINAE

Young similar to adult but crown paler; chin and throat white, rest of underparts paler with a pectoral line of indistinct black spots. Postjuvinal moult complete. Postnuptial moult complete, about August–September.

MEASUREMENTS

Wing ♂♂ 53–57; ♀♀ 49–52 mm (Rand & Fleming)

Weight 2 ♂♂ 8.5, 9; 3 ♀♀ 6.7–7 g (RAP).

COLOURS OF BARE PARTS. As in 1819.

1819. Eastern Redheaded Tit. *Aegithalos concinnus rubricapillus* (Ticehurst)

Aegithalus concinna rubricapillus Ticehurst, 1925, Bull. Brit. Orn. Cl. 46: 22 (Sikkim) Baker, FBI No. 77 (part), Vol. 1: 93

LOCAL NAME. *Pyiong-sanyi* (Lepcha).

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. As in 1818, q.v.

STATUS, DISTRIBUTION and HABITAT. Common resident, subject to seasonal movements. Nepal (where grading into *iredalei*) eastward through Sikkim, Darjeeling dist., Bhutan and Arunachal Pradesh. Breeds between 1400 and 2700 m, possibly up to 3200 m, wandering in winter up to 3600 m (Sikkim) or down to 600 m (Bhutan foothills). Affects light deciduous forest and secondary growth of brambles etc.; sometimes deodar or pine forest.

Extralimital. Adjacent areas of southeastern Tibet. The species ranges north to Kansu, east to Chekiang, Formosa, Kwantung and northern Vietnam.

GENERAL HABITS, FOOD and VOICE. As in 1818.

BREEDING. As in 1818.

MUSEUM DIAGNOSIS. Differs from *iredalei* (1818) in having the crown darker, the back more slaty, and in being smaller (cf. weight).

204

AEGITHALINAE

Aegithalos leucogenys, *A. niveogularis*, *A. iouschistos* and *A. bonvaloti*

Distributional ranges

■ *niveogularis* (1822) ■ *iouschistos* (1823)
 ■ *bonvaloti* (SE. Range imperfectly known) ■ *leucogenys* (1821)

MUSEUM DIAGNOSIS. See Field Characters. Bill stouter and more strongly curved on culmen than in *A. niveogularis* (1822).

Young similar to adult but crown paler, cheek-band cream instead of white, black of throat replaced by dull pinkish brown with dusky bases to the feathers; an indistinct pectoral band of blackish streaks.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	57–59	c. 8	c. 17	53–57 mm
♀♀	52–55			49–52 mm

(Paludan, MD, CBT)

Weight 4 ♂♂ 6.5–7.4; 3 ♀♀ 6.1–7 g (RAP). 5 ♂♂ (breeding) 6.8; 4 ♀♀ (breeding) 6–7 g — Paludan.

COLOURS OF BARE PARTS. Iris pale straw. Bill black. Legs and feet pinkish brown; claws brown.

1822. Whitethroated Tit. *Aegithalos niveogularis* (Gould)

Atanhiparus niveogularis Gould, 1855, Bds. Asia 2(7), pl. 67

(North India, restricted to northern Punjab by Vaurie, 1957,

Amer. Mus. Novit., No. 1853: 20)

Baker, FBI No. 84, Vol. 1: 98

Plate 95, fig. 2

LOCAL NAMES. None recorded.

LONGTAILED TITMICE

205

SIZE. Sparrow — ; length c. 10 cm (4 in.).
FIELD CHARACTERS. Above, forehead and forecrown white, diffusing into buffy brown on hindcrown and nape. A broad black eye-stripe, the two bands partially meeting on nape. A narrow buffish brown band across upper back; rest of back grey. Wings greyish brown with dark brown shoulders. Tail greyish brown with narrow white outer edge. Below, throat and sides of neck white forming a collar interrupted on back. A brown band across breast. Belly vinaceous buff. Sexes alike.

The white throat and forehead, and black eye-stripe, help to identify the species.

STATUS, DISTRIBUTION and HABITAT. Uncommon resident, subject to vertical movements. The western Himalayas from Kagan Valley eastward through Kashmir, Himachal Pradesh (Duala Dhar, Kulu, Simla) and Garhwal. Breeds between 2400 and 3300 m, in Garhwal up to 3600 m, descending in winter to c. 1800 m. Affects deciduous forest of birch, cherry or oak, mixed forest of birch and silver fir or spruce and deodar; also dwarf willows and rhododendrons at timber-line.

GENERAL HABITS. Those of the genus (cf. 1818). Hunts in small parties, often in company with leaf warblers, *Parus dichrous* and *Alcippe rufipectus*, working energetically through bushes and foliage of trees.

FOOD. Chiefly insects.

VOICE and CALLS. While foraging, a frequently uttered high-pitched *wee* reminiscent of the Goldfinch.

BREEDING. Season, May to early July. Nest, an oval or pear-shaped purse, similar to that of the Redheaded Tit, with a lateral entrance-hole near the top; made of moss and cobweb, covered with lichen and copiously lined with feathers; placed in a fork in bushes between one and three metres up, or suspended to branches of trees (fir etc.) up to nine metres or so above the ground. Eggs, white, rather feebly spotted pink at the larger end, varying in size between 14.3 × 11.2 and 14 × 10.8 mm (Baker). Clutch size and other details of breeding biology unknown.

MUSEUM DIAGNOSIS. See Field Characters. Bill longer, straighter and more slender than in *A. leucogenys* (1821).

This species differs from *A. iouschistos* (1823) not only by colour pattern but also by its larger size and length of bill, and colour of the iris.

Young similar to adult but throat pinkish white, pectoral band darker and more conspicuous, and rest of underparts more buff, less pink.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂ ♀	60-65	9-11	18	52-58 mm (Vaurie, MD)

COLOURS OF BARE PARTS. Iris dark brown (Abbott) or reddish brown (HW). Bill black. Legs and feet orange-brown or yellowish brown.

206

AEGITHALINAE

1823. **Rufousfronted Tit.** *Aegithalos iouschistos iouschistos* (Hodgson)
P. (erus) iouschistos Hodgson, 1844, in Blyth, Jour. Asiat. Soc. Bengal 13: 941 (Nepal)
Baker, FBI No. 85, Vol. 1: 99
Plate 95, fig. 3

LOCAL NAMES. None recorded.

SIZE. Sparrow — ; length c. 10 cm (4 in.).

FIELD CHARACTERS. Above, forehead and a broad medial coronal band buff, more ochraceous on forehead and nape. A broad black eye-stripe. Eye yellow. Sides of neck ochraceous buff; rest of upperparts grey. Wing with a darker shoulder-patch. Tail with narrow white outer edge. Below, centre of throat silvery white, the base of feathers and chin blackish. Malar stripe, sides of throat and rest of underparts rufous-cinnamon. Sexes alike. Roundish silvery throat-patch, broad greyish 'centre parting' on crown, and ferruginous underparts identify the species.

STATUS, DISTRIBUTION and HABITAT. Common resident, subject to erratic seasonal movements. The Himalayas from central Nepal (Proud, JBNHS 50: 362; Fleming & Traylor, Fieldiana 53: 185) east through Arunachal Pradesh (Ludlow, Ibis 1944: 68).¹ Occurs between 2700 and 3600 m at all seasons, descending to c. 2400 m during cold spells. Affects low, scrubby deciduous trees and bushes, shrubby undergrowth of rose, barberry, holly oak and bamboo in conifer and mixed forest; also visits dense evergreens after the breeding season. Appears to be more plentiful in the drier zone. Extralimital. Southeastern Tibet and southwestern Szechuan.

GENERAL HABITS. Keeps in pairs when breeding, otherwise in parties up to 30 individuals by themselves or in company with *Parus rubidiventris*, *P. dichrous* and other insectivorous species, however not in the same localities with *Aegithalos concinnus* (GD). Forages in the crowns of high trees as well as in bushes.

FOOD. Insects and their eggs and larvae. Also some vegetable matter.

VOICE and CALLS. Constantly utters a short sharp note as it flits from twig to twig.

BREEDING. Season, from circumstantial evidence, May to July. Nest and eggs unknown.

MUSEUM DIAGNOSIS. See Field Characters.

Young similar to adult but underparts including throat paler cinnamon.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂ ♀	53-60	9-10	17-19	45-53 mm (Vaurie, Stres., SA, MD)

Weight 3 ♂♂ (May) 6.5-7.5 g (GD). 3 ♂♂ (winter) 7, 7, 7 g—SA.
COLOURS OF BARE PARTS. Iris lemon-yellow. Bill black. Legs and feet yellow or orange-brown to dark brown.

¹ An allied species, *P. boncaloti sharpei*, occurs on Mt Victoria from 2500 m to the summit, down to 2100 m in winter, and may be expected in the high ranges of Manipur and Nagaland.

NUTHATCHES

207

Family SITTIDAE: Nuthatches and Creepers

Subfamily SITTINAE: Nuthatches

For description see Baker, E. C. S., 1922, FBI 1: 120-1; Witherby, H. F., et al., 1938, 1: 240-1; Van Tyne, J. & Berger, A. J., 1959: 513; Hans Lohrl, 1964, article 'Nuthatch' in Thomson, A. L. (ed.), *A New Dictionary of Birds*, London & New York.

Whitetailed Nuthatch (1834)

Genus *SITTA* Linnaeus

Sitta Linnaeus, 1758, Syst. Nat., ed. 10, 1: 115.

Type, by monotypy, *Sitta europaea* Linnaeus

Bill a little longer than the head, straight, horizontally compressed towards the tip, which is neither notched nor toothed. Nostrils partly hidden by bristles and feathers; no rictal bristles. Wings long, about twice the length of tail; first primary (as.) short. Tail short and square. Tarsus short covered anteriorly with transverse scales; hallux with claw longer than middle toe, and longer than tarsus.

Sitta Cashmirensis Brooks, 1871, Proc. Asiat. Soc. Bengal: 209 (Kashmir)
Baker, FBI No. 114, Vol. 1: 128

Plate 96, fig. 4

LOCAL NAMES. None recorded.

SIZE. Sparrow — ; length c. 12 cm (4½ in.).

FIELD CHARACTERS. Above, bluish slaty. A black band from lores through eye to nape. Tail, when expanded, blackish with white subterminal spots. Below, sides of head and chin whitish grading to cinnamon on breast, darker (chestnut) on flanks and vent. Female similar to male but paler below.

For distinction from *S. castanea* and *S. himalayensis*, see 1827 and 1834.
STATUS, DISTRIBUTION and HABITAT. Common resident, subject to vertical movements. Pakistan in N.W.F.P. from Shingar and the Takht-i-Sulaiman (N. Baluchistan, Christison, JBNHS 43: 479) north to Chitral, thence east through Kagan Valley, Murree (?), the Pir Panjal and Kashmir to the

NUTHATCHES

209

Liddar Valley.¹ Breeds between 2100 and 3000 m locally down to c. 1800 m (Kashmir), and up to 3300 m in Chitral. Descends more regularly to c. 1800 m in winter. Affects forest of pine, deodar and fir, mixed forest and deciduous groves of poplar, walnut, etc.

Sitta europaea

1 *cashmirensis* (1824) 2 *nagaensis* (1826)
3 *montium* (1825) 4 Extralimital subspecies

Extralimital. Adjacent parts of Afghanistan. For range of the species see 1825.

GENERAL HABITS. Outside the breeding season generally found in twos or threes among the roving parties of tits, warblers and tree creepers. Hunts energetically on tree-trunks and larger branches, climbing without the aid of its tail (unlike woodpecker), progressing in little spurts in all directions up or down or around horizontal branches, sometimes creeping jerkily along their undersides. Keeps to a lower stratum than *S. leucopsis* and may occasionally be observed foraging on the ground.

FOOD. Insects, seeds and nuts; grit often found in stomachs. Extracts kernels from hard-shelled seeds or nuts by wedging them into a hollow or crevice ('socket') on a branch and hacking them open by persistent hammer-blows of the strong pointed bill (SA).

VOICE AND CALLS. Ordinary call-note, a pleasant, rippling trill; a harsh alarm-note 'recalling in miniature the scream of a jay' (HW).

BREEDING. Season, end of April to end of June. Nest, placed in hollows in trees, often a woodpecker hole, the entrance of which is reduced with

¹ Breeding record by Whympers at Naini Tal 4500 feet (Baker, *Nidification* 1: 95) pertains to *S. castanea*.

14

NUTHATCHES

211

VOICE AND CALLS. Alarm-note, a loud 'chitter' resembling the note of the British Greenfinch, in no way resembling the corresponding call of the European subspecies (Stanford).

BREEDING. Probably as in 1824.

MUSEUM DIAGNOSIS. Differs from *cashmirensis* (1824) in having the underparts grey strongly washed with buff, the lower flanks chestnut and the under tail-coverts white tipped with chestnut. Differs from *nagaensis* by the buff wash on breast.

MEASUREMENTS

	Wing	Bill (from skull)
♂♂	76-89	19-20 mm
♀♀	74-88	19-21 mm

(Kleinschmidt & Weigold, Mayr, NBK)

COLOURS OF BARE PARTS. Iris brown. Bill greyish black, grey-blue at base of lower mandible. Legs and feet plumbeous grey.

1826. **Naga Nuthatch.** *Sitta europaea nagaensis* Godwin-Austen

Sitta nagaensis Godwin-Austen, 1874, Proc. Zool. Soc. London: 44 (Naga Hills)
Baker, FBI No. 113, Vol. 1: 127

Plate 96, fig. 1

LOCAL NAME. *Daomejo-gopu* (Cachari).

SIZE. Sparrow —; length c. 12 cm (4½ in.).

FIELD CHARACTERS. As in 1825 but underparts ashy. Flanks chestnut.

STATUS, DISTRIBUTION AND HABITAT. Common resident. The Patkai Bumai Range, Nagaland, Manipur, and the Cachar and Khasi hills. Breeds between 1400 and 2600 m; occasionally up to 2800 m. Affects mixed deciduous and evergreen forest, coniferous, and light deciduous forest.

Extralimital. Adjacent parts of Burma (Kachin and Chin hills south to Mt Victoria). An apparently isolated population in the high hills of southern Vietnam has been linked to this subspecies.

GENERAL HABITS AND FOOD. As in 1824.

VOICE AND CALLS. Song, a loud, clear, rapid piping or trilling, similar to that of the European subspecies but softer and less full or sometimes near identical. Call-note, a peculiar drawn-out nasal *tjab* (Heinrich).

BREEDING. Season, March to June. Nest, a pad of fur and scraps of bark placed in a tree-hole as in 1824. Eggs, as in 1824; average size of 8 eggs 18.6 × 13.8 mm (Baker).

MUSEUM DIAGNOSIS. Differs from *montium* by the pure ashy colour of underparts.

MEASUREMENTS

Wing 10 ♂♂ 75-81; 2 ♀♀ 72, 75 mm (Stresemann)

Weight 2 ♀♀ 13.5, 16.5 g (SDR).

COLOURS OF BARE PARTS. Iris dark brown. Bill blackish grey at base of lower mandible. Legs and feet greenish brown.

210

SITTINAE

plastered wet mud to a diameter just large enough for the bird to scrape through; lining material not described but birds have been observed to take fine flakes of bark from the trunks of trees. 'The Nuthatch works with meticulous care and little jerky movements, pecking at the mud ["trowelling"] incessantly, most of the time with its head downwards' (HW). As a rule the masonry work is not prominent, but at times may take the form of a protruding short cone; the plastering occasionally extends for some distance around the hole, filling up any little depressions and smoothing them off. Chipped pieces of masonry showed small seeds within (Bates & Lowther). The masonry is often of terracotta hardness and not easily broken with the fingers whilst at other times it is quite friable and comes away easily. The nest-hole may be at any height from two to nine metres or more above the ground. Eggs, 5 to 7, white, marked with reddish spots and small blotches. Average size of 50 eggs 19.7 × 14.4 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters and Key to the Subspecies.

MEASUREMENTS

Baker, FBI No. 111 (part), Vol. 1: 125

LOCAL NAME. *Siri* (Hindi).

SIZE. Sparrow —; length c. 12 cm (4½ in.).

FIELD CHARACTERS. Male. Above, bluish slaty. A black band from lores to upper back; a prominent white malar patch. Expanded tail shows black rectrices with white subterminal spots. Below, chin white, rest of underparts chestnut. Under tail-coverts white and chestnut.

Female similar but underparts cinnamon.

Male easily distinguished from both Kashmir and Whittailed Nuthatches (1824, 1834) by the rich chestnut underparts and well-defined white malar patch. Female distinguished from the Kashmir Nuthatch by better defined cheek-patch and white on under tail-coverts; *S. himalayensis* has the throat and breast ochraceous buff, not dull cinnamon, the black eye-stripe shorter, and white base of tail.

STATUS, DISTRIBUTION AND HABITAT. Common resident. The western Himalayas from Chakrata (western U.P.)¹ east to east-central Nepal, between c. 300 and 1500 m at all seasons. Affects deciduous woods and pine forest.

GENERAL HABITS AND FOOD. As in 1828.

VOICE AND CALLS. Very different from that of the European Nuthatch (GD); see 1828 for description. Song period in Nepal January to April with a resumption from August to October (Proud).

BREEDING. As in 1828. Average size of 30 eggs 19.4 × 14.8 mm (Baker).

MUSEUM DIAGNOSIS. Bill heavy. Underparts in male cinnamon-brown. Under tail-coverts ashy grey with broad white subterminal patches and cinnamon fringes. Both sexes differ from *cinnameiventris* in being paler.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	81-87	21-24	{ 18-20 18-19	40-44 mm
♀♀	78-85			40-48 mm

(HW, BB)

SITTINAE

Sitta castanea

Distributional ranges 1 *almorae* (1827) 2 *cinnamomensis* (1828) 3 *koelzi* (1829) 4 *castanea* (1830) 5 *pratieri* (1831) 6 Extralimital rates

Weight 8 ♂♂ 17.4-20.9; 5 ♀♀ (Oct.-Nov.) 19.9-20.5; 2 oo? (Oct.-Nov.) 20, 20.9 g (RAP, GD).

COLOURS OF BARE PARTS. Iris dark brown to reddish brown. Bill: upper mandible black with bluish slaty on base; lower mandible bluish slaty with black anterior quarter. Legs and feet slaty horny; claws horny; soles grey-white to white.

1828. Eastern Chestnutbellied Nuthatch. *Sitta castanea cinnamomensis* Blyth

Sitta cinnamomensis Blyth, 1842, Jour. Asiat. Soc. Bengal 11: 459 (Darjeeling) Baker, FBI No. 111 (part), Vol. 1: 125

LOCAL NAMES. *Sidhi-ship* (Lepcha); *Chor-parki* (Bengali).

SIZE. Sparrow —; length c. 12 cm (4½ in.).

FIELD CHARACTERS. As in 1827, q.v.

STATUS, DISTRIBUTION AND HABITAT. Common resident. The eastern Himalayas from eastern Nepal east through Arunachal Pradesh, in the Garo, Khasi and Mizo hills, Manipur and the hills of Bangladesh to the Chittagong Hill Tracts (see map, above). Occurs at all seasons, in Nepal from the terai to c. 1800 m, optimum zone 600-1500 m; in Sikkim between 600 and 1700 m; in Bhutan up to 1600 m but mostly below 1000 m. Also occurs in the northern half of the plains of the Jalpaiguri district. South of the Brahmaputra occurs from the base of the hills to 1800 m. Affects chiefly deciduous forest.

Extralimital. The species ranges east to Vietnam.

NUTHATCHES

215

1829. Naga Chestnutbellied Nuthatch. *Sitta castanea koelzi* Vaurie

Sitta europaea koelzi Vaurie, 1950, Amer. Mus. Novit., No. 1472: 5 (Patkai Hills, Assam-Burma border) Baker, FBI No. 111 (part), Vol. 1: 125

LOCAL NAME. *Dao-mojo-gajao* (Cachari).

SIZE. Sparrow —; length c. 12 cm (4½ in.).

FIELD CHARACTERS. As in 1827, q.v.

STATUS, DISTRIBUTION AND HABITAT. Resident. The Patkai range, Nagaland and North Cachar, from the edge of the plains to c. 1500 m. Affects deciduous and semi-evergreen forest.

GENERAL HABITS, FOOD AND VOICE. As in 1828.

MUSEUM DIAGNOSIS. Adult male not separable from *cinnamomensis*. Female differs by richer cinnamon of underparts, and by being darker above.

MEASUREMENTS AND COLOURS OF BARE PARTS. As in *cinnamomensis* (1828).

1830. Peninsular Chestnutbellied Nuthatch. *Sitta castanea castanea* Lesson

LOCAL NAMES. *Kathipet zad-chad* (Gujarati); *Sin* (Hindi); *Chor-parki* (Bengali).

SIZE. Sparrow —; length c. 12 cm (4½ in.).

FIELD CHARACTERS. As in 1827, q.v.

STATUS, DISTRIBUTION AND HABITAT.

Resident, common but locally distributed.

Practically all India roughly east of a line

from Ferozepore in Punjab (c. 30°N.,

75°E.) to Nasik in Maharashtra (c. 20°N.,

74°E.). Eastward along the terai and

through the Gangetic Plain to Bihar

(Darbhanga, Rajmahal Hills) and southern Bengal (Nadia, c. 23°N., 88°E.).

Southward (presumably) more or less throughout the Peninsula including eastern Rajasthan, Madhya Pradesh, Maharashtra, Orissa and Andhra (excepting range of *pratieri*, 1831, q.v.) in the appropriate biotope. South of c. 16°N. has been recorded in southern Karnataka (Antarsante, Bandipur, Biligirirangan Hills, Coorg), Tamil Nadu (Nülgiri Hills), and Kerala (Wynaad and Palghat Hills). Not yet recorded from large intervening areas. Affects light forest, mango topos and groves near villages, roadside trees, etc. in deciduous plateau and foothills country; avoids coastal areas.

T. R. Bell's 1905 sight record for Sind (see *Ibis*, 1922) is incredible. It was doubted by the observer himself, and should be discarded (see Abdulali, JBNHS 49: 303-4).

GENERAL HABITS. As in 1828. Usually met with in mixed hunting parties, often with *Picoides nanus*. Keeps largely to the tops of lofty trees.

FOOD. Insects, grubs, seeds and nuts. Among stomach contents in an intensively cultivated tract in Bihar, the following insects have been identified: Ants (*Crematogaster subnuda* — Formicidae), weevils (*Mylocherus discolor*,

216

SITTINAE

Tanymericus sp. — Curculionidae), beetles (*Mesomorphus villiger* — Tenebrionidae), and remains of various other small coleoptera, jassids, tabanids, noctuids and hemipterons — in addition to spiders (Mason & Lefroy, 1912).

VOICE AND CALLS. A mousy, quick-repeated double note *chilp-chilp* (SA). Also a tremulous whistle and a shrill squeak resembling that of the musk shrew (*Suncus*). Song, a loud clear whistling *whew* quickly repeated four or five times thus *whewwhewwhewwhew*.

The sound of hammering on bark often betrays its whereabouts.

BREEDING. Season, February to May in the north, April to September in Andhra Pradesh. *Nest*, placed in a hollow in a tree from near the ground up to at least nine metres. The cavity is almost invariably lined with bits of fine bark and dry leaves. As in other subspecies, the hollow is walled up with a plaster of wet mud, brought in blob by blob, leaving a tiny round aperture just large enough for the bird to scrape through. The cement is reinforced with resin assiduously collected from a nearby babool (*Acacia arabica*) or suchlike tree, and kneaded and pummelled into position by repeated jabs of the bill (Gill, SA). The masonry often attains a thickness of nearly 5 cm and dries to terracotta hardness. Some plastering around the aperture is in evidence even when originally of appropriate size. *Eggs*, normally 4 or 5, white to pale pink marked with reddish spots, specks and minute blotches, more so towards the large end. Average size of 60 eggs 17 × 16.5 mm (Baker). Incubation by both sexes (Baker). However, according to Gill (JBNHS 29: 110) the female 'never leaves the eggs till they are hatched; she is fed assiduously by the male'. Period of incubation 11 or 12 days.

MUSEUM DIAGNOSIS. Bill fine and short. Underparts in male deep chestnut, darker than in *cinnamomensis*. Under tail-coverts ash-grey with chestnut fringes. See Key to the Subspecies.

MEASUREMENTS	Wing	Bill (from skull)	Tarsus	Tail
♂♂	72-82	18-21	17-19	36-42 mm
♀♀	71-78	18-20		35-41 mm

(HW, SA)

Weight 1 ♂ 12 g (Roonwal).

COLOURS OF BARE PARTS. Iris brown. Bill: upper mandible black, lower grey at base; mouth pale pink. Legs and feet dark brown; soles pale yellow.

1831. Eastern Ghats Chestnutbellied Nuthatch. *Sitta castanea pratieri* Whistler & Kinnear

Sitta castanea pratieri Whistler & Kinnear, 1936, Jour. Bombay nat. Hist. Soc. 35: 522 (Anantagiri, Vishakhapatnam Dist.) Baker, FBI No. 110 (part), Vol. 1: 123

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 12 cm (4½ in.).

FIELD CHARACTERS. As in 1827, q.v.

NUTHATCHES

217

STATUS, DISTRIBUTION and HABITAT. Common resident. The Eastern Ghats in Orissa and Andhra Pradesh from Jeypore (c. 19°N.) southward to the Godavari river, at c. 900 to 1000 m. Affects deciduous forest.

GENERAL HABITS, FOOD and VOICE. As in 1830.

BREEDING. As in 1830.

MUSEUM DIAGNOSIS. Differs from *castanea* (1830) in having a longer bill, and the under tail-coverts ash-grey with narrow pale subterminal band and chestnut fringes. Underparts of male similar to *cinnamomeiventris* (1828) and paler than in *castanea*. Underparts of female more pink than in *cinnamomeiventris*.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail

SITTA LEUCOPSIS Gould
Key to the Subspecies

Breast buffish white.....*S. l. leucopsis*
Breast rufous.....*S. l. przewalskii*

1832. Western Whitecheeked Nuthatch. *Sitta leucopsis leucopsis* Gould
Sitta leucopsis Gould, 1850, Bds. Asia 2(1), pl. 46 (Himalayas)
Baker, FBI No. 117, Vol. 1: 130
Plate 96, fig. 6

LOCAL NAMES. None recorded.

SIZE. Sparrow — ; length c. 12 cm (4½ in.).

FIELD CHARACTERS. Above. Crown and sides of nape black; sides of head, including broad supercilium, white. Rest of upperparts dark bluish slaty. Expanded tail shows black outer rectrices with a white subterminal spot on the three outer pairs and a narrow white streak along the outer edge of the outermost. Below, buffish white. Lower flanks and under tail-coverts rich chestnut.

The white of face extending above the eye, bordered above by the black of crown, identifies the species.

STATUS, DISTRIBUTION and HABITAT. Fairly common resident, subject to vertical movements. N.W.F.P. from the Safed Koh to Chitral, Gilgit, Balistan, and the Murree hills, and eastward along the Himalayas to Garhwal (JBNHS 28: 143 and 53: 320), from c. 2100 m to timber-line (c. 3300 m), optimum zone 2400-3000 m. Descends in winter locally to 1800 m. Affects forests of pine, fir and deodar, occasionally mixed forest.

Extralimital. Adjacent parts of eastern Afghanistan. Range disjunct from that of the western China population.

GENERAL HABITS. As in other members of the genus but keeps to the tops of the taller conifers (mostly) and smaller branches and is therefore difficult to see. Its presence is usually detected by its peculiar call-note (q.v.). Sometimes perches on the highest twig of a dead tree, flicking its wings and jerking from side to side.

1833. Eastern Whitefaced Nuthatch. *Sitta leucopsis przewalskii* Berezovski & Bianchi
Sitta przewalskii Berezovski & Bianchi, 1891, Pütsi Kansus. Putschest. G.N. Potanina: 119 (Mindshu dist., upper Hwangho R., eastern Tsinghai. China)
Not in Baker, FBI

LOCAL NAMES. None recorded.

SIZE. Sparrow — ; length c. 12 cm (4½ in.).

FIELD CHARACTERS. As in 1832 but breast rufous (v. buffish white).

STATUS, DISTRIBUTION and HABITAT. May occur in northern Arunachal Pradesh in the Tsangpo Bend area (see Extralimital, below). Affects chiefly conifer forest.

Extralimital. Southeastern Tibet west to Tse (c. 94°30'E. long.) at c. 2800-3000 m (Ludlow, *Ibis* 1951: 555) and the mountains of western China north to Tsinghai and Kansu.

GENERAL HABITS, FOOD and VOICE. Probably as in 1832.

BREEDING. Unrecorded; probably as in 1832.

MUSEUM DIAGNOSIS. Differs from *leucopsis* (1832) in being rufous on breast and abdomen rather than buffish white. Bill much weaker, thinner and shorter, averaging 17 mm in four adults as against 21 in a long series of nominate *leucopsis*. Wing length averages about 4 mm shorter (Vaurie).

MEASUREMENTS

	Wing	Bill (from skull)	Tail
♂♂	76-81	21-22	39-45 mm
♀♀			40-44 mm (Vaurie)

COLOURS OF BARE PARTS. Unrecorded.

SITTA HIMALAYENSIS Jardine & Selby

Plate 96, fig. 2

LOCAL NAME. Siddyi-ship (Lepcha).

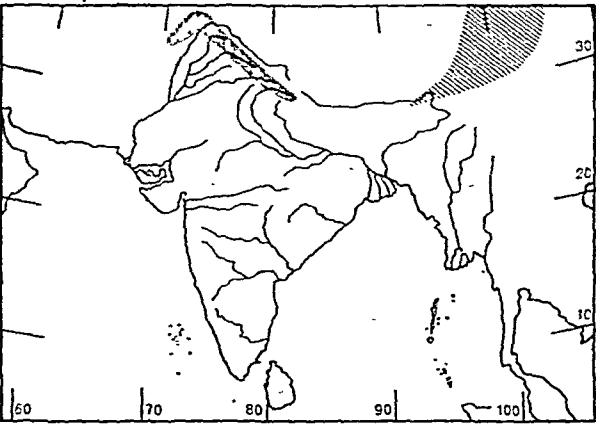

SIZE. Sparrow — ; length c. 12 cm (4½ in.).

FIELD CHARACTERS. Above, bluish slaty. A black eye-stripe from lores to nape. A white patch at base of tail. Expanded tail shows black rectrices with white spots. Below, throat buff shading to ochraceous on breast and deep rufous on lower parts. A white patch under wing visible in flight.

218

SITTINAE

Sitta leucopsis

Distributional ranges

□ *leucopsis* (1832) ▨ *prezawskii* (1833)

FOOD. Insects and seeds (of *Pinus excelsa*, *P. gerardiana*, etc.).

VOICE and CALLS. Ordinary call-note, incessantly uttered while foraging, a curious plaintive squeak, or 'wailing bleat of a small kid', rendered as *quair-quair* (HW) or *pain*, pronounced like the French word for bread (Whitehead). It is a characteristic sound of the conifer forest and often the only sign of the bird's presence. Also a common double-note like *bavain bavain* of the same quality as above (Magrath).

BREEDING. Season, end of April to early July. Nest, a pad of moss, grass and a few leaves, lined with fur; placed in holes or crevices in trees shattered by lightning, generally at great heights — from 6 to 30 metres above the ground — exceptionally in a hole in the ground below a root (Whitehead). No masonry is used to reduce entrance-hole. Eggs, 4 to 8, pinky white with numerous reddish spots; similar to those of *Sitta europaea* but more delicately marked. Average size of 75 eggs 18 × 13.8 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters and 1833. Postnuptial moult complete, July to October.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	74-79	(one) 22 }	18-19	39-40 mm (Paludan, MD)
♀♀	73-75	(one) 21 }		

Weight 10 ♂♂ 13.5-15.9; 3 ♀♀ 14.7-15.1 g (Paludan, RAP).

COLOURS OF BARE PARTS. Iris brown. Bill blackish, base of lower mandible whitish or pale grey. Legs and feet greenish brown.

220

SITTINAE

Distinguished from other nuthatches by the white patch at base of tail; from the Assam subspecies (1835) by longer eye-stripe, extending on to shoulder.

STATUS, DISTRIBUTION and HABITAT. Common resident, subject to seasonal movements. The Himalayas from Chamba c. 76°E. (replaced by *S. europaea* west of this locality) eastward through Arunachal Pradesh. Breeds between 1500 and 3000 m, in eastern Nepal and Sikkim up to 3300 or 3400 m,

Sitta himalayensis

Distributional ranges

□ *himalayensis* (1834) ▨ *australis* (1835)
■ *vicariae* (RE)

overall optimum zone 1800-2700 m. In Sikkim noted as low as 950 m in winter. Affects deciduous or evergreen broad-leaved forest, chiefly oak and rhododendron; shows a preference for mossy forest.

Extralimital. Ranges east to Yunnan and the northern Indochinese countries.

GENERAL HABITS. Keeps in pairs or scattered parties, often among the mixed hunting bands of tits and small babblers. Appears to forage mostly on the mossy branches, much less on trunks (Diesselhorst). Creeps jerkily along the upper or under side of moss-covered boughs or up and around tree-trunks with astonishing agility, prying into crevices in the bark or under the moss in search of insects, presently flying off to another tree nearby to resume the hunt. Occasionally found in low shrubs.

FOOD. Mainly insects; also kernels of nuts and seeds. The nut is fixed in a suitable hollow or 'socket' in a branch and hacked open by determined hammer-blows of the pointed bill.

NUTHATCHES

221

VOICE and CALLS. The birds maintain contact with one another by a feeble mousy *chip-chip*. In the breeding season, a clear, spirited, tit-like whistling song *wheel-wit-wit-wit* quickly repeated six to eight times, uttered by male with neck partially upstretched, from a perch in a tree (SA). Song period February to May (Proud).

BREEDING. Season, mid March to early May. Nest, a hole in a tree, usually an oak, between 1 and 15 metres above the ground, lined with moss or rhododendron leaves. Where the hole is too large, the entrance is reduced to suit the size of the bird by masonry work with wet clay. Eggs, 4 to 7, white densely covered with dark red spots and small blotches, generally more numerous at the larger end where they may form an ill-defined ring. Average size of 25 eggs 18.6 × 13.4 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters; also for distinction from the Assam subspecies *australis*.

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	69-77	15-19	17-21	35-42 mm
♀♀	68-76			33-40 mm
			(Vaurie, BB, NBK, SA)	

Weight 13 ♂♂ 14-17; 10 ♀♀ 14.3-16 g (RAP, GD). 4 ♂♂ (winter) 12-16; 4 ♀♀ (winter) 12-15 g—SA.

COLOURS OF BARE PARTS. Iris brown. Bill: upper mandible blackish brown, lower pale plumbeous with horny brown tip. Legs, feet, claws, pale horny brown; soles greyish white.

1835. Assam Whitetailed Nuthatch. *Sitta himalayensis australis* Koelz

Sitta himalayensis australis Koelz, 1951, Jour. Zool. Soc. India 3: 29 (Tekhubama, Naga Hills, Assam)

Sitta himalayensis lushaiensis Koelz, 1952, Jour. Zool. Soc. India 4: 37 (Hmuntha, Lushai Hills)

Baker, FBI No. 108 (part), Vol. 1: 122

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 12 cm (4½ in.).

FIELD CHARACTERS. As in 1834, q.v.

STATUS, DISTRIBUTION and HABITAT. Fairly common resident in Nagaland, Manipur and in the Cachar and Mizo (Lushai) hills, above c. 1700 m. Affects moist, broad-leaved evergreen forest.

Extralimital. Adjacent hills of Burma.

GENERAL HABITS, FOOD and VOICE. As in 1834.

BREEDING. Unrecorded; probably as in 1834.

MUSEUM DIAGNOSIS. Differs from *himalayensis* (1834) in having a shorter post-ocular stripe (not extending on to the shoulder). Rufous of underparts fading to white on centre of throat and chin.

MEASUREMENTS

Wing 5 ♂♂ 72-76; 5 ♀♀ 71-76 mm (Koelz)

Weight 1 ♂ 15; 1 ♀ 14 g (SDR).

COLOURS OF BARE PARTS. Iris brown. Bill black, base of lower mandible grey. Legs and feet dark greenish brown or dark yellowish brown.

NUTHATCHES

223

in being larger, glossier, more sparsely and boldly spotted. Average size of 50 eggs 21.1 × 16.6 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters. Postnuptial moult complete, from the middle of July to the middle of October, occasionally later.

First-winter plumage not distinguishable with certainty from that of adult. Post-juvenal moult of body-feathers, lesser and median wing-coverts, takes place at the same time as the postnuptial moult of adults.

MEASUREMENTS

	Wing	Bill (from skull)
♂♂	85-90	26-27 mm
♀♀	85-88	26-29 mm

(Vaurie, southern Afghanistan)

1 ♀ Tarsus 25; tail 50 mm (MD)

Weight 3 ♂♂ (August) 33-35; 3 ♀♀ (August) 31-32 g (Paludan, northern Afghanistan).

COLOURS OF BARE PARTS. Iris dark brown. Bill black, livid at base of lower mandible. Legs and feet grey.

1837. Beautiful Nuthatch. *Sitta formosa* Blyth

Sitta formosa Blyth, 1843, Jour. Asiat. Soc. Bengal 12: 938 (Darjeeling)

Baker, FBI No. 118, Vol. 1: 131

Plate 96, fig. 8

LOCAL NAMES. *Tishe kuyi gumbo* (Lepcha); *Dao-mojo-gadeba* (Cachari).

SIZE. Sparrow ±; length c. 15 cm (6 in.).

FIELD CHARACTERS. A large, showy, black and blue nuthatch. Above, crown and upper back black with brilliant blue and lilac streaks. Wing black with blue outer edge and shoulder, white bars and white edge to tertials. Scapulars and rump pale blue. Tail blue with black shaft-lines; expanded tail shows black rectrices with white subterminal spots. Below, sides of head buffish white with dark ear-coverts. Chin and upper throat creamy white grading to rufous-clay on lower parts. Sexes alike.

In flight a white patch on the black underwing conspicuous from below.

STATUS, DISTRIBUTION and HABITAT. Resident, subject to vertical movements, rare and locally distributed. Sikkim, Bhutan (?), the Dafia, Abor and Mishmi hills, Nagaland, Manipur, the Cachar and Khasi hills, and the Chittagong Hill Tracts. Recorded in summer between 1500 and 2100 m (2400 *vide* Inglis), and in winter between 330 and 2000 m. Affects deep forest.

Extralimital. Extends east to northern Vietnam.

GENERAL HABITS. Little known. Keeps in pairs or small family parties of 4 or 5 usually high up in lofty trees. Actions and behaviour characteristic of the genus, but slower, resembling those of a woodpecker as when clambering about the branches or hammering away on the bark. Flight fast.

VOICE and CALLS. A typical nuthatch call though less harsh than that of *S. europaea* and lower pitched than almost any other nuthatch's.

BREEDING. Season, April to June. Nest, a hollow in a tree between c. 2 and 8 metres above the ground, lined with some leaves, chips of bark and

222

SITTINAE

1836. Eastern Rock Nuthatch. *Sitta tephronota tephronota* Sharpe

Sitta tephronota Sharpe, 1872, Ann. Mag. Nat. Hist. 10: 450

(Kokand, Ferghana, Central Asia)

Baker, FBI No. 116, Vol. 1: 129

Plate 96, fig. 5

LOCAL NAMES. None recorded.

SIZE. Sparrow ±; length c. 15 cm (6 in.).

FIELD CHARACTERS. A comparatively large rock-inhabiting nuthatch. Above, ashy grey. A black eye-stripe from lores to nape. Outer edge of tail and tips of outer rectrices pale buff. Below, throat, sides of head and neck, and breast creamy white grading to pinkish buff on lower belly and flanks. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Fairly common resident, subject to vertical movements. Baluchistan from the Sulaiman Range southwest to Nushki and Kalat, and possibly through the ranges of central Makran as the species occurs in Iranian Baluchistan. Affects rocky valleys with broken cliffs and jumbles of boulders especially where there are streams, from c. 300 m in winter to c. 2500 m in summer.

Extralimital. Extends north to the Tien Shan and southern Transcaspia. The species ranges west to Armenia.

GENERAL HABITS. Usually solitary or widely separated pairs; often breeding in family parties of 5 or 6, or maybe two such parties together. An extraordinarily active bird, jerkily clambering about on almost every type of rock face, however perpendicular and precipitous, in search of insects lurking within the unevennesses.

FOOD. Insects and seeds.

VOICE and CALLS. Call-note, *pit-pit-pit*. Song(?), a chattering though pleasing call (Williams).

BREEDING. Season, February to June. Nest, a remarkable structure of clay like a little oven protruding from the substrate 'much like a woman's breast'. In some cases comparatively small (c. 30 cm in diameter); in others the clay portion may cover as much as three square feet (a third of a square metre). Foundation of one nest examined measured c. 75 × 45 cm. The point of the mud entrance is sometimes prolonged in the shape of a cone sticking out of the cliff-face for about 15 cm, at the end of which is the actual entrance-hole, 35 mm or so in diameter. The nest is lined with fur of small mammals and feathers. Feathers and other bright objects are sometimes stuck into the clay outside (Williams, JBNHS 33: 599). The structure is usually shaded from the sun by overhanging rock. As a rule it is not built high up on the rock-face, often near the entrance of a deep cleft, and quite often within easy hand reach. The clay plaster is usually laid on over crevices or in shallow angles of rocks and frequently also 'against holes in trees, which were invariably furnished with the same masonry inside and outside while often feathers were used to decorate the bark of the trunk all round the nest' (Barnes *apud* Baker, *Nidification* 1: 99; also Murray *apud* Ticehurst, JBNHS 31: 695). Eggs, normally 4, white, spotted and blotched with light chestnut to chestnut-brown with secondary markings of pale pinkish lavender, sometimes absent. Differ from those of other nuthatches

SITTINAE

224

fur of small mammals. Entrance-hole reduced with clay masonry when too large. Eggs, clutch size apparently 4 to 6, like large eggs of *S. castanea* (1828). Average size of 6 eggs 21.1 × 15.6 mm; of 20 eggs, including 4 small added ones, 20.8 × 15.3 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters.

LOCAL NAMES. *Mākhmāli zad-chad* (Gujarat); *Dao-mojo-bulu-gajas* (Cachari); *Pasai edukira kūrūni* (Tamil); *Tandan kili* (Malayalam); *Panu-kurulla* (Sinhalese).

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. A small purplish blue nuthatch with velvety black forehead, red bill, orange-yellow orbital skin and yellow eye.

Male. Above, forehead and a long supercilium black. Rest of upperparts purplish blue. Expanded tail shows black rectrices with greyish terminal band. Below, ear-coverts lavender. Chin and centre of throat white grading to drab brown more or less suffused with lavender on lower part.

Female similar but without the black supercilium.

STATUS, DISTRIBUTION and HABITAT. Resident, locally abundant. Widely distributed in the better wooded:

roughly east and south of a line . . . to Navsari in Gujarat (c. 21°N., 73°E.). Eastward along the lower Himalayas, (including Nepal, Sikkim and Bhutan) through Arunachal Pradesh; thence south through Assam, Meghalaya, Nagaland, Manipur, Mizoram and Bangladesh to the Chittagong Hill Tracts. Bengal and southward through the Peninsula to Kerala and Tamil Nadu; and Sri Lanka. From plains level to c. 1500 m, locally to c. 2200 m in the Himalayas, and the peninsular and Sri Lanka hills. Common in the Eastern and Western Ghats complexes (including Nilgiri and Palni hills), and fairly common locally elsewhere in the appropriate evergreen and moist-deciduous biotope. Avoids arid areas. Affects rather open broad-leaved forest and mixed bamboo jungle, evergreen sholas, shade-trees in tea, coffee and cardamom plantations, etc. Also mangrove forest (*Sonneratia apetala* etc.) in the Khulna Sunderbans.

NUTHATCHES

225

Sitta frontalis

Distributional ranges

▨ *frontalis* (1838)

▨ Extralimital subspecies

Extralimital. Ranges east through Burma, the Indochinese countries, Hainan, southern Sumatra and Java. Other subspecies in Malaysia, Borneo and the Philippines.

GENERAL HABITS. Similar to those of other nuthatches. Keeps in pairs or small parties sometimes up to a dozen individuals, usually in mixed hunting associations often including *Sitta castanea*. Hunts on the moss-covered branches of large trees, creeping jerkily up and down or around them with the agility of a mouse, inspecting little nooks and crannies and hammering away at the bark like a woodpecker. Also forages in brushwood and on fallen logs but does not seem to visit the ground. Sometimes will cling back downwards on the underside of a branch and scuttle along thus with astonishing celerity. A bird has been observed in this inverted position on a horizontal twig at top of a bare tree, head stiffly turned down at a right angle, bill pointing to the ground, remaining 'frozen' thus for no apparent reason for over three minutes!

FOOD. Insects and their larvae.

VOICE AND CALLS. A rapid series of loud high-pitched cheeping whistles; often the latest diurnal bird-call to be heard after dusk, even after the last Grey Junglefowl has ceased to crow.

BREEDING. *Season*, April to June in the north, January to May in the south and in Sri Lanka. *Nest*, a hole in a branch or trunk of a tree between one and twelve metres above the ground, lined with moss, fur and feathers. Size of entrance reduced with masonry work if too large, but hole chosen

226

TICHODROMADINAE

usually so small as to even require enlarging. *Eggs*, 4 or 5 in the north, 3 or 4 in the south, like small, rather richly marked eggs of *S. castanea*, some of them with large red blotches and more like tit's eggs. Average size of 50 eggs 17.2 × 13.2 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters. Contrary to the normal condition in nature (Bergmann's Rule, see Vol. 1: xlii) Himalayan birds in this case are smaller than south Indian and Ceylonese examples.

Young, like adult but black frontal band not so broad nor so pure black. Ear-coverts less lilac, more brownish. Chin and throat duller. Under tail-coverts edged with rusty brown.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	70-82	15-16	15-17	37-45 mm
♀♀	69-80			35-44 mm

(HW, Koelz, SA, BB, Mukherjee)

Weight 13 ♂♂ 11-14.5; 4 ♀♀ 10-13.4; 1 ♂♂ 8.5 g (RAP, GD, SDR).

COLOURS OF BARE PARTS. Iris yellow; eye-rim orange-yellow to orange-red. Bill coral-red, tip of upper mandible brown; palate coral-red. Legs and feet pinkish brown; soles orange-yellow. **Young.** Iris brown. Bill black, pink at gape and nostrils; mouth coral-red.

Subfamily TICHODROMADINAE: Wall Creepers

For description see Baker, E. C. S., 1922, FBI 1: 441 (Genus *Tichodroma*); Hans Löhr, 1964, article 'Nuthatch' in Thomson, A. L. (ed.), *A New Dictionary of Birds*, London & New York.

Genus TICHODROMA Illiger

Tichodroma Illiger, 1811, Prodrum: 210. Type, by monotypy, *Certhia muraria* Linnaeus

Cf. Vaurie, C., 1957, *Arct. Mus. Novit.*, No. 1858: 1-8

Bill very long, slender, slightly curved, longer than head, with long, narrow nostrils. Wing very large, rounded; first primary (as.) about half the length of second; second and third primaries falling short of tip of wing. Tail of twelve soft rectrices. Tarsus smooth; hind claw longer than its toe.

1839. Wall Creeper. *Tichodroma muraria nepalensis* Bonaparte

T. (tichodroma) nepalensis Bonaparte, 1850, *Consp. Gen. Av.* 1: 225 (Central Asia)
Baker, FBI No. 457, Vol. 1: 441

Plate 96, fig. 9

LOCAL NAMES. *Dracl gajrak* (Pashu); *Lamba dider* (Kashmir); *Supperetra* (Chamb); *Sag-gersa-lamdong-pha* (Lepcha).

SIZE. Sparrow; length c. 17 cm (6½ in.).

WALL CREEPERS

227

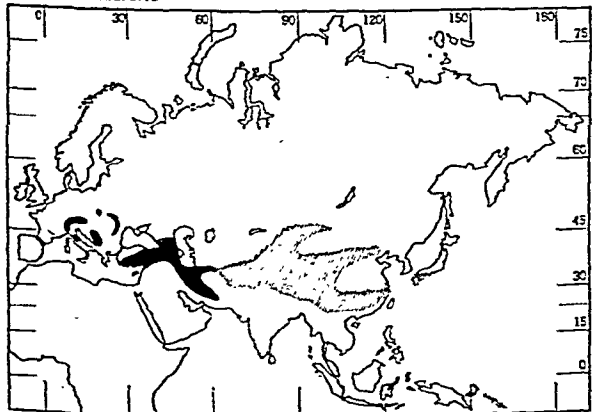

FIELD CHARACTERS. Winter. Above, crown pale brown; a white eye-rim. Back ashy. Wings blackish brown with bright crimson shoulder and outer edge, the primaries with round white spots very conspicuous in flight. Tail comparatively short, blackish brown with grey tip, the outer rectrices mostly white. Below, throat and upper breast white; rest of underparts dark slaty.

× c. 1

Summer. Crown ashy like back. Throat and upper breast black. Sexes practically alike.

At a distance, general appearance and actions confusingly like Rock Nuthatch, both when creeping up a rock face and on the wing. At close range easily identified by unique crimson wings continually flicked while climbing.

STATUS, DISTRIBUTION AND HABITAT. Resident, subject to vertical movements and winter wandering. Fairly common but sporadic. Pakistan from the Safed Koh to Hunza, thence east through Ladakh, Kashmir and along the Himalayas through Arunachal Pradesh. Breeds mostly above 3300 m,

Tichodroma muraria

Distributional ranges

▨ *nepalensis* (1839)

▨ *muraria* (RE)

possibly down to c. 2700 m locally, and up to permanent snow-line (young bird obtained in July at 6400 m in Ladakh — Meinertzhagen). In winter (October to March or early April) commonly reaches the foothills in suitable country, and sometimes wanders considerable distances into the plains

228

TICHODROMADINAE

(Salt Range, Lyallpur, Lahore, Fatehpur Sikri, Dehra Dun, Etawah, Ghazipur, Delhi, etc.). Affects gorges and vertical cliffs, especially near streams or small cascades; in winter also visits earth cliffs, concrete walls, buildings and archaeological ruins, and boulders in river-beds.

Extralimital. Extends to Transcaucasia, Altai, Hopeh and Fukien. Nominatē race from Iran to the Alps and the Pyrenees.

GENERAL HABITS. Solitary or in pairs. Seldom seen away from cliffs although it has been noted paying regular visits to the wooden walls of a Kashmir houseboat, and once observed climbing the trunk of a tree. On vertical cliffs, climbs in jerky zigzag spurts continually flicking its crimson wings and poking its long bill into small crannies for insects and spiders. Now and again will let go its hold and tumble through space to explore the scarp lower down, or loop off and fly to another cliff, where active hunting is forthwith resumed. Unlike nuthatches, will often fly high over a valley or forest when moving to a distant hunting-ground. Flight undecided and very hoopoe-like, also reminiscent of a large butterfly, with alternated flappings and pauses. 'Occasionally attempts to take an insect on wing' (HW).

FOOD. Chiefly spiders, also diptera, beetles and other insects and larvae.

VOICE AND CALLS. Recorded within our limits only as 'a plaintive cheeping noise' (A. B. Aitken). A very silent bird. In the Alps its call-note has been noted as a melodious rather fast *ti-oo-ū ti-oo-ū*, first and third note highest, second note lower. Song, uttered in the breeding season and on sunny days in autumn and early spring, a thin, slow ascending phrase of four sliding notes *tiu tush-tee-ū*, a very short pause after the first note, third note highest and very thin. Both call-note and song rather weak and not audible beyond c. 80 metres under favourable circumstances (MD).

BREEDING. *Season*, May to July. *Nest*, a pad of wool, hair and grass placed in crevices of rocks, usually inaccessible. *Eggs*, white with a few black or deep red-brown specks at the larger end. Clutch-size and egg measurements unrecorded within our territory. Extralimital: c/4 to 6, averaging 21.3 × 14.9 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters. Summer plumage acquired by pre-nuptial body moult about February–March. Postnuptial moult complete.

Young. *Atter*, as in female in winter plumage, but head dark grey with plum-coloured gloss, deep plum round the eyes. Upper back very pale, pearl grey, shading into darker grey on lower back. Primaries tipped with pearly white. *Below*, as in winter male. Many of these colours fading rapidly in dried skins (Meinertzhagen).

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	100-115	26-30	22-26	53-58 mm
♀♀	92-104			57-60 mm

(SA, MD, Rand & Fleming)

Weight 6 ♂♂ 13-19 g (Paludan, RAP, SA). 2 ♀♀ 16.5, 18 g (SA). 3 juv. 18.2-19.2 g (GD).

COLOURS OF BARE PARTS. Iris dark brown. Bill black, lower mandible white at base. Legs and feet blackish brown.

SPOTTED CREEPERS

229

Subfamily SALPORNITINAE: Spotted Creepers

For description see below, under Genus *Salpornis*

Genus *SALPORNIS* Gray

Salpornis Gray, 1847, Proc. Zool. Soc. London: 7. Type, by original designation, *Certhia spilnotus* Franklin

x c. 1

SALPORNIS SPILONOTUS (Franklin)

Key to the Subspecies

Upperparts greyer.....*S. s. rajputanae*
Upperparts darker, underparts more heavily marked *S. s. spilonotus*

1840. **Rajasthan Spotted Grey Creeper.** *Salpornis spilonotus rajputanae* R. & A. Meinertzhagen

Salpornis spilonotus rajputanae R. & A. Meinertzhagen, 1926, Bull. Brit. Orn. Cl. 46: 83 (Sambhur)

Baker, FBI No. 456 (part), Vol. 1: 439

LOCAL NAME. *Rākhodi thad-chad* (Gujarat).

SIZE. Sparrow — ; length c. 13 cm (5½ in.).

FIELD CHARACTERS. As in 1841, q.v.

STATUS, DISTRIBUTION AND HABITAT. Resident. Central and southeastern Rajasthan (including the Aravalli Hills) from Sambhar to Mt Abu. Habitat as in 1841.

GENERAL HABITS, FOOD AND VOICE. As in 1841.

BREEDING. As in 1841.

MUSEUM DIAGNOSIS. Like *spilonotus* (1841) but upperparts greyer, ground colour hair-brown, markings not so intense black. Underparts paler, sandier and less heavily marked.

MEASUREMENTS AND COLOURS OF BARE PARTS. As in 1841.

1841. **Indian Spotted Grey Creeper.** *Salpornis spilonotus spilonotus* (Franklin)

Certhia spilonota Franklin, 1831, Proc. Zool. Soc. London: 125 (Vindhyan Hills)

Baker, FBI No. 456 (part), Vol. 1: 439

Plate 96; fig. 14

LOCAL NAMES. None recorded.

SIZE. Sparrow — ; length c. 13 cm (5½ in.).

TREE CREEPERS

231

forwards instead of ascending the tree in the jerky spiral so characteristic of *Certhia* (Newnham, JBNHS 13: 194). First alights near the base of a tree-trunk rapidly creeping up to and along the upper branches, clinging to them upside down merely stopping now and again to investigate a crevice, and soon flying off to an adjacent tree. When alighting on a tree-trunk 'tumbles' on to it with wings open, rather like a quail pitching into grass, in contrast to a woodpecker which sweeps gracefully upwards with wings closed before clinging to the bole (SA).

FOOD. Insects and spiders.

VOICE AND CALLS. A feeble whistling song of the volume and timbre of a sunbird's, of about five seconds' duration, *chichichiu-chi-chiu-chiu-chiu* (SA).

BREEDING. Season, March to May. Nest, a deep cup fixed in a crotch of a thin leafless acacia or suchlike tree, or on a slender branch at its junction with a vertical shoot, some 3 to 5 metres above the ground. Composed of leaf-stalks, bits of leaves, lichen and chips of bark, lined with soft spider egg-bags, and cemented exteriorly with cobwebs, cocoons, caterpillar frass and vegetable down, perfectly camouflaged against the bark of supporting branches and practically invisible from below. Inside diameter of cup c. 45 mm, thickness of wall c. 12 mm, depth of cup c. 45 mm. Nest very strong though soft and pliant in the hand, 'almost as flabby as if it was jelly'. Eggs, 2 or 3, pale greenish grey with dark brown specks and paler secondary blotches, specially at the large end. Two eggs measure 19.5 × 13 and 19 × 13 mm (SA); average size of 6 eggs '16.9 × 13 mm' (Baker). Incubation by both sexes; period unrecorded.

MUSEUM DIAGNOSIS. Differs from *rajputanae* (1840) in being darker.

MEASUREMENTS		Wing	Bill (from skull)	Tarsus	Tail
2	♂♂	90	25, 26	17	52, 53 mm
3	♀♀	87-89	24-28	17	49-51 mm (SA)

Weight 1 ♂ 14 g (SA).

COLOURS OF BARE PARTS. Iris dark brown. Bill horny brown, lower mandible flesh colour. Legs and feet bluish black.

Family CETHIIDAE: Tree Creepers

For description see Baker, E. G. S., 1922, FBI 1: 428; Van Tync, J. & Berger, A. J., 1959: 516; Ferguson-Lees, I. J., 1964, article 'Treecreeper' in Thomson, A. L. (ed.), *A New Dictionary of Birds*, London & New York.

Genus *CERTHIA* Linnaeus

Certhia Linnaeus, 1758, Syst. Nat., ed. 10, 1: 118. Type, by subsequent designation, *Certhia familiaris* Linnaeus

Bill as long or nearly as long as the head, slender and curved downwards. Nostrils long and narrow. Tarsus scutellated. Toes and claws very long.

230

SALPORNITINAE

Salpornis spilonotus and *Certhia familiaris*

Distributional ranges

- spilonotus* (1841)
- rajputanae* (1840)
- hodgsoni* (1842)
- mandellii* (1843)
- khamensis* (1844)

FIELD CHARACTERS. A mottled brown bird with slender, longish curved

x c. 1

bill, reminiscent of both tree creeper and nuthatch. Above, entirely dark brown spotted with white. A white supercilium and dark ear-coverts. Tail barred brown and white. Below, throat white, rest of underparts fulvous spotted and barred with dark brown. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Resident; on the whole scarce and patchily distributed, but not uncommon locally. The central Indian Peninsula from Gurgaon (near Delhi), Gonda (U.P.) and the 'Bihar terai' (Hume) east to Manbhum, south through eastern Madhya Pradesh (Bastar dist.) roughly to the Godavari river (Sironcha, Ahmednagar) and west to Khandesh, Rajpipla and Deesa. Affects fairly open deciduous forest of *Acacia*, teak, etc. and mango groves, in the plains and hills.

Extralimital. Other subspecies in Africa south of the Sahara.

GENERAL HABITS. Usually met with singly or in pairs, sometimes in mixed company. Has a preference for trees with deep-fissured bark such as *tendu* (*Diospyros* sp.), babool (*Acacia nilotica*) and khair (*A. catechu*) for its foraging. Flutters and clambers rapidly up the trunks and branches 'with a vivacity and ease reminding one of a Wall Creeper' (Babault). 'Resembles a nuthatch more than a creeper as it works the branches backwards and

1842. **Kashmir Tree Creeper.** *Certhia familiaris hodgsoni* Brooks

Certhia Hodgsoni Brooks, 1872, Jour. Asiat. Soc. Bengal 41: 74 (Cashmir)

Baker, FBI No. 450, Vol. 1: 434

LOCAL NAMES. None recorded.

SIZE. Sparrow — ; length c. 12 cm (5 in.).

FIELD CHARACTERS. Above, fulvous brown spotted with whitish on crown and back; a white supercilium. A short wing-bar and an oblique buff band across wing. Tail longish, pointed, brown, unbarred. Below, white. Sexes alike.

x c. 1

Distinguished from *C. himalayana* by unbarred tail.

STATUS, DISTRIBUTION AND HABITAT. Common resident. The western Himalayas from Gilgit, Astor and Murree east through Kashmir to Lahul, from c. 2100 m up to timber-line. Apparently less common in Kashmir than *himalayana* but the two doubtless often confused in the field. Affects forests of pine, deodar, fir and mixed birch and fir.

Extralimital. The species extends from western Europe to Japan. Also cold and temperate conifer forests of North America.

GENERAL HABITS. Solitary, sometimes in twos or threes, usually in mixed hunting parties of tits and other small birds. Creeps up tree-trunks in short jerky spurts, searching the crevices and bark for insects — sometimes drops or slithers lower, in 'reverse gear' and works up again. After working up to near the top, flies off to another tree, alighting on the trunk near its base and scuttling upward in the same way. Occasionally also on moss-covered rocks.

FOOD. Insects and spiders.

VOICE AND CALLS. Undescribed. Extralimital: call-note a thin *tut*; song, a very thin, short phrase on a descending scale.

BREEDING. Little recorded. Season, May and June. Nest (undescribed) placed in cracks in tree-trunks or behind loose outflanking bark, from 3 to 12 metres above the ground. Eggs, 5 or 6, white stippled with reddish

TREE CREEPERS

233

specks, more numerous at the larger end. Average size of 25 eggs 15.8 × 11.9 mm (Baker). Care of young by both parents.

MUSEUM DIAGNOSIS. Differs from *mandellii* (1843) in being much paler, less rufous above and in lacking rufous tinge on vent and lower flanks.

MEASUREMENTS

	Wing	Tarsus	Tail
♂ ♀	63-66	c. 17	60-61 mm (Baker)

Bill from skull 16-20 mm

Weight 3 ♂♂ (Nov.-Dec.) 7.6-9.9 g (RAP).

COLOURS OF BARE PARTS. As in 1843.

1843. **Mandelli's Tree Creeper.** *Certhia familiaris mandellii* Brooks

Certhia Mandellii Brooks, 1874, Jour. Asiat. Soc. Bengal 42: 256 (Sikkim)

Baker, FBI No. 448 (part), Vol. 1: 433

Plate 96, fig. 10

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 12 cm (5 in.).

FIELD CHARACTERS. As in 1842 but darker; spots rufous, rump ferruginous.

Distinguished from *C. himalayana* by absence of barring on tail; from *C. discolor* by white throat and breast; from *C. nipalensis* by white breast and earth-brown lower flanks (v. buff breast and ferruginous flanks).

STATUS, DISTRIBUTION and HABITAT. Common resident, subject to vertical movements. The Himalayas from Kulu to extreme western Arunachal Pradesh (Tawang), replaced at higher altitudes in Bhutan by the next subspecies. Occurrence south of the Brahmaputra doubtful (cf. Baker, *Nidification* 1: 413); also said to have been obtained from Shillong (Hume) and Nagaland (Godwin-Austen) [SF 11: 85. No extant specimens.]. Breeds from c. 2700 m up to timber-line (4200 m in eastern Nepal) mostly above 3300 m. Recorded in winter between 1700 m (Sikkim) and 3600 m (Nepal). Presumably not above 3000 m in Bhutan. Affects forests of fir, deodar, birch and rhododendron. Occurs in pure coniferous as well as in pure birch forest.

GENERAL HABITS, FOOD and VOICE. As in 1842.

BREEDING. Unrecorded (see 1842).

MUSEUM DIAGNOSIS. Differs from *hodgsoni* in being darker, more rufous brown above and in having the vent and lower flanks tinged with rufous.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	63-70	15	17	55-57 mm
♀♀	63-66	13	17	55 mm

(SA, NBK)

Weight 3 oo? adult (summer) 9-10; 4 juv. 9.2-10.2 g (GD). 2 ♂♂ (July) 9.3, 9.3 g (RAP).

COLOURS OF BARE PARTS. Iris brown. Bill: upper mandible horny brown, lower pinkish flesh. Legs, feet and claws horny brown.

TREE CREEPERS

235

STATUS, DISTRIBUTION and HABITAT. Altitudinal and short-range migrant. Pakistan from Ziarat north through N.W.F.P. to Chitral and Hunza, thence east through Gilgit, Astor and Baltistan to Skardu, and from Murree to eastern Kashmir. Breeds from c. 2100 m, locally 1800 m, up to timber-line, optimum zone 2400-3000 m. Affects forests of pine, fir, deodar and juniper. In winter (end October to end March or early April) found mostly below

1800 m (occasionally up to c. 2400 m) down to the foothills and into the plains of the Indus south to Bahawalpur (Chachran, Harunabad, Bhong). In this season frequents orchards, village groves, roadside avenues, and sheesham trees in forest plantations and Canal Bungalow compounds, even where these are isolated far amidst treeless semi-desert tracts.

Extralimital. Eastern Afghanistan.

GENERAL HABITS. Those of the genus, cf. 1842. May be seen in small family parties after breeding, but later usually singly — one to a tree or among roving bands of tits, leaf warblers, etc. Works up the tree-trunks and along the larger boughs like a nuthatch, starting from the base and climbing in short spurts, investigating the crevices in the bark. Having attained a fair height, immediately flies off to another tree, again starting at the bottom and jerking its way upward directly or in irregular spirals. Normally avoids thin branches with no roughnesses in the bark for tiny insects to lurk. Occasionally seen foraging on stone retaining walls in winter.

VOICE and CALLS. Call-note, a low long-drawn squeak. Song, a loud, vigorous and very rapid *tis, yip yip yip yip yip* (Alexander). May be heard throughout the year, more lustily in the breeding season.

234

CERTHIIDAE

1844. **Tibetan Tree Creeper.** *Certhia familiaris khamensis* Bianchi

Certhia khamensis Bianchi, 1903, in Sharpe, Handl. Gen. Sp. Bds. 4: 355, 360 (Kansu . . . upper Mekong = Kham, upper Mekong)

Baker, FBI No. 449, Vol. 1: 434

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 12 cm (5 in.).

FIELD CHARACTERS. As in 1842, q.v.

STATUS, DISTRIBUTION and HABITAT. Bhutan, presumably above 3500 m (specimens from Wangdo Chu and Lamthang, NW. Bhutan, 3500, 4150 m Sept. [SDR coll.]; Arunachal in the Pachakshiri region between 2900 and 4000 m (Ludlow, *Ibis* 1944: 176). Status and habitat as in 1843.

Extralimital. Extends to northern Yunnan and northern Szechuan. For range of species see 1842.

GENERAL HABITS, FOOD and VOICE. As in 1842.

BREEDING. Unrecorded.

MUSEUM DIAGNOSIS. Like *mandellii* but upperparts darker and less rufous. Belly, flanks and under tail-coverts pale smoke colour instead of rufous. Young greyer than adult, less rusty, especially on rump.

MEASUREMENTS

Wing 9 ♂♂ 68-72 mm; bill from skull 17-18 mm (NBK)

Weight 2 oo? (Sept.) 8.5, 10 g (SDR).

COLOURS OF BARE PARTS. Iris brown, dark brown. Bill: upper mandible black, lower whitish flesh. Legs and feet brown to dark brown.

1845. **West Himalayan Tree Creeper.** *Certhia himalayana limes* Meinertzhagen

Certhia himalayana limes Meinertzhagen, 1922, Bull. Brit. Orn. Cl. 42: 141 (Gilgit)

Baker, FBI No. 444 (part) and 445 (part), Vol. 1: 430, 431

LOCAL NAME. *Koel dider* (Kashmir).

SIZE. Sparrow —; length c. 12 cm (5 in.).

FIELD CHARACTERS. Above, brown mottled with pale grey. Supercilium whitish. A short whitish bar and an oblique buff band on wing, conspicuous in flight. Tail longish, pointed, pale brown distinctly barred with dark brown. Below, chin and throat white grading to buffish on belly and smoky on flanks. Sexes alike.

At close range distinguished from *C. familiaris* by barred tail. Long curved bill a helpful character in identification.

236

CERTHIIDAE

BREEDING. Season, early April to June. Nest, loosely made of twigs, dry grass or assorted materials and lined with feathers; usually placed behind the loose bark of a large tree, sometimes in cracks or crevices of trees split by lightning, from near the ground up to 15 metres or so, usually rather low down. Eggs, 4 or 5, white profusely marked all over with reddish brown freckles, forming an indistinct zone around the large end. Average size of 34 eggs 15.8 × 12.2 mm (Baker). Both sexes build the nest, which takes a couple of weeks to complete. Incubation apparently by female alone; male feeds female on nest. Incubation period 13 or 14 days; care of young by both parents; young leave the nest in about three weeks (Dodsworth, *JBNHS* 20: 463-71).

MUSEUM DIAGNOSIS. Intermediate between *taeniura* and *himalayana*; upperparts not so rufous as in *himalayana* but not so grey as in *taeniura*; crown almost as dark as in *himalayana*, but underparts paler.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail

(Himalayan Mountains, restricted to Kumaon or Garhwal by Meinertzhagen,
1922, Bull. Brit. Orn. Cl. 42: 140)
Baker, FBI No. 444 (part), Vol. 1: 430
Plate 96, fig. 11

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 12 cm (5 in.).

FIELD CHARACTERS. As in 1845, q.v.

STATUS, DISTRIBUTION AND HABITAT. Fairly common resident, subject to vertical movements; from eastern Kashmir east to Kumaon, breeding between 1500 and 3600 m (timber-line), optimum zone 2000–3000 m. Winters from c. 2100 m, mostly below 1400 m, down to the foothills and adjacent plains (Ambala district). Affects forests of spruce, pine, deodar and rhododendron. Generally avoids pure oak forest, where it is replaced by *C. discolor*.

GENERAL HABITS, FOOD AND VOICE. Occasionally flutters off the bark to take an escaping moth in the air. Song, 'a loud but squeaky rapid *chi-chi* . . . *chiu-chiu-chiu* (or *tri-tri* . . . *triu-triu-triu*) of the volume and quality of the *tree-tee* flight-song of Redwinged Bush Lark (*Mirafra erythroptera*)' — SA.

BREEDING. As in 1845.

MUSEUM DIAGNOSIS. Upperparts more rufous than in *lines*, underparts darker.

MEASUREMENTS AND COLOURS OF BARE PARTS. As in 1845.

1848. *West Nepal Tree Creeper*. *Certhia himalayana infima* Ripley

Certhia himalayana infima Ripley, 1950, Proc. Biol. Soc. Washington 63: 106
(Tikapur, Kailali District, Western Nepal)
Baker, FBI No. 444 (part), Vol. 1: 430

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 12 cm (5 in.).

FIELD CHARACTERS. As in 1845, q.v. See Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Resident, subject to vertical movements. Eastern Kumaon (where intergrading with *himalayana*) and western Nepal east to c. 81°31' long.¹ Two Hodgson specimens from Nepal in Brit. Mus. Occurs from c. 2500 m (October) down to the terai in winter. Summer distribution and habitat probably as in 1847.

GENERAL HABITS, FOOD AND VOICE. As in 1845.

BREEDING. Unrecorded.

MUSEUM DIAGNOSIS. Differs from *himalayana* by being conspicuously darker, more blackish on the upper surface. This race has sharply defined narrow streaks of buffy white on the head, nape and upper back. The rufous colour on the tips of the feathers of the lower back is stronger and darker than in *himalayana*. On the tail also the barring is more blackish as well as stronger and more distinct. There is no size difference.

MEASUREMENTS AND COLOURS OF BARE PARTS. As in 1845.

¹ The range of the species appears to be discontinuous in the Himalayas (see map, p. 235). The nearest populations occur in northern Burma (*yunnanensis*) and on Mt Victoria between 2300 and 3000 m (*ripponi*). Both may be expected in adjacent areas of India.

TREE CREEPERS

239

in the breeding season from 1800 to 2700 m, and in winter from 300 to 2700 m in Nepal and from 700 to 3600 m in Sikkim. Affects mossy oak and rhododendron forest. Prefers broad-leaved forest but also frequents conifers.

GENERAL HABITS. Those of the genus.

FOOD. Insects and spiders.

VOICE AND CALLS. Little recorded. Call, a sharp, quick-repeated *chip-chip-chip-chip* (SA). Song said to be 'typically tree creeper's'; see also 1850. Song period, early February to May (Proud).

BREEDING. Season, March to May (from circumstantial evidence). Nest and eggs undescribed.

MUSEUM DIAGNOSIS. See Field Characters. For distinction from *manipurensis* see 1850.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	67–76	17–20	17–20	73–82 mm
♀♀	64–72	16–18	17–18	73–77 mm

(SA, Rand & Fleming, MD)

Weight 7 ♂ ♀ (Mar.) 10–11; 3 ♂♂ (Oct.) 10–11 g — SA. 2 ♂♂ 10.4, 10.5; 2 ♀♀ 9.6, 10.6 g (GD).

COLOURS OF BARE PARTS. Iris brown. Bill; upper mandible dark brown, lower whitish, yellowish white or pinkish white; gape inside fleshy. Legs and feet pale brown.

1850. *Manipur Tree Creeper*. *Certhia discolor manipurensis* Hume

Certhia manipurensis Hume, 1881, Stray Feathers 10: 151 (Eastern Hills, Manipur)
Certhia victoriar Rippon, 1906, Bull. Brit. Orn. Cl. 16: 87 (Mount Victoria)
Baker, FBI No. 452, Vol. 1: 437

LOCAL NAMES. *Dao-mojo* (Cachar); *Inru-m-jet* (Naga); *Voh-ti-ti-ling* (Manipur).

SIZE. Sparrow —; length c. 12 cm (5 in.).

FIELD CHARACTERS. As in 1849, q.v.

STATUS, DISTRIBUTION AND HABITAT. Resident, locally common. Nagaland (Godwin-Austen), Manipur, and probably the Khasi and Cachar hills (Baker, JBNHS 17: 791 and 13: 563; cf. also *Nidification* 1: 413).¹ Occurs between c. 900 and 2300 m (on Mt Victoria from 1400 to 3000 m but more frequent in the lower part of its zone). Affects mostly deciduous forest, occasionally pine woods.

Extralimital. The Chin Hills and south to the Arakan Yomas. The species extends east through Burma to Yunnan, Laos and Vietnam.

GENERAL HABITS AND FOOD. Those of the genus.

VOICE AND CALLS. Song described as a loud sharp double-note repeated several times *tija tija* . . . *tija* — (Heinrich); also rendered as a shrill *duuce-tee*, *duuce-tee* (Smythies).

BREEDING. Season, chiefly April and May. Nest, a pad of fibres, moss, rootlets and a few feathers placed in cracks or shallow holes in trees c. 2 to 4

¹ Records from Khasi and Cachar hills not supported by specimens; however no other tree creeper seems to occur south of the Brahmaputra.

CERTHIIDAE

CERTHIA DISCOLOR Blyth

Key to the Subspecies

Paler, more fulvous above *C. d. discolor*
Darker, less fulvous above *C. d. manipurensis*

1849. *Sikkim Tree Creeper*. *Certhia discolor discolor* Blyth

C. (certhia) discolor Blyth, 1845, Jour. Asiat. Soc. Bengal 14: 580 (Darjeeling)
Baker, FBI No. 451, Vol. 1: 435
Plate 96, fig. 13

LOCAL NAMES. *Silsuli* (Paharia); *Saddyer-pha* (Lepcha); *Chud sydi* (Assam).

SIZE. Sparrow —; length c. 12 cm (5 in.).

FIELD CHARACTERS. Above, dark brown streaked with fulvous. Supercilium fulvous. A short bar and an oblique buff band across wing. Rump ferruginous. Tail rufous-brown. Below, throat and breast earth-brown to tawny brown. Belly paler, greyish to buffish. Under tail-coverts ochraceous. Axillaries white. Sexes alike.

Easily identified by its dark throat. All other creepers have a white throat.

STATUS, DISTRIBUTION AND HABITAT. Fairly common resident, subject to vertical movements and winter wandering. The Himalayas from western Nepal (Rand & Fleming, 1957) east through Arunachal Pradesh. Obtained

Certhia discolor

■ Distributional ranges

1 *discolor* (1849) 2 *manipurensis* (1850)

3, 4 Extralimital subspecies

240

CERTHIIDAE

metres above the ground. Eggs, apparently 3 or 4, differing from those of *himalayana* and *familiaris* in being more densely marked with deeper red-brown, tiny blotches and freckles. Average size of 11 eggs 15.9 × 12.3 mm (Baker).

MUSEUM DIAGNOSIS. Like *discolor* (1849) but dark feathers of upperparts blacker with less fulvous. Chin, throat and upper breast reddish fulvous; belly and flanks more tinged with fulvous.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♀	66–71	15–16	17–18	65–68 mm
Wing ♂♂ 67–73; ♀♀ 64–69 mm (Sires. — Mt Victoria)				
Weight 1 ♂ 11; 1 ♀ 10 g (SDR).				

COLOURS OF BARE PARTS. As in 1849.

C. (certhia) nipalensis 'Hodgson' = Blyth, 1845, Jour. Asiat. Soc. Bengal 14: 581 (Nepal)

Certhia Stoliczkae Brooks, 1874, Jour. Asiat. Soc. Bengal 42: 256 (Sikkim)
Baker, FBI No. 455, Vol. 1: 438

Plate 96, fig. 12

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 12 cm (4½ in.).

FIELD CHARACTERS. Above, crown and upper back very dark brown streaked with fulvous. A very broad, buff supercilium. Mantle rusty brown with dark scale-like markings. Rump rusty. Wing marked with a buff wing-bar and buff oblique band. Tail brown, unbarred. Below, throat whitish. Breast and centre of belly cream-buff. Flanks tawny-olive, rusty on lower part. Sexes alike.

Short, straight bill a helpful character in identification. Distinguished from *discolor* by whitish throat; from *himalayana* by unbarred tail; from *familiaris* by buff breast and tawny flanks (i.e. white and greyish).

STATUS, DISTRIBUTION AND HABITAT. Resident, subject to vertical movements, apparently uncommon. Western Nepal from c. 81° long. (Fleming & Traylor, 1961) east along the Himalayas through Sikkim, Bhutan and Arunachal Pradesh (Ludlow, *Ibis* 1944: 177). Possibly also the hills of North Cachar (Baker, loc. cit.) but no specimens extant. Recorded in summer between 2700 and 3500 m and in winter between 1500 and 3500 m. Affects oak forest and mixed deciduous and conifer forest.

Extralimital. Ranges east to northern Burma and southeastern Tibet (Pome).

GENERAL HABITS. Keeps singly or in pairs, often among the roving parties of tits, nuthatches and other creepers (Fleming, Stanford). According to Meinertzhagen seldom in hunting parties. Seems to keep to more

PIPITS AND WAGTAILS

241

Certhia nipalensis

Distributional range

rotten and mossy trees than other tree creepers, seldom ascending high up into the branches. Movements slow and more deliberate.

FOOD. Insects.

VOICE and CALLS. Unrecorded. A very silent bird, thus difficult to locate.

BREEDING. Unknown. Season, about May.

MUSEUM DIAGNOSIS. See Field Characters.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	66-76	14-17	18-20	75-81 mm
♀♀	66-71			69-76 mm

Weight 2 ♂♂ (May-June) 11.5, 11; 2 ♀♀ (May-June) 11, 11 g (GD). 1 ♂ (Feb.) 12; 1 ♀ (Nov.) 10 g (SA).

COLOURS OF BARE PARTS. Iris brown. Bill: upper mandible black, lower pinkish white. Legs and feet brown.

Family MOTACILLIDAE: Pipits and Wagtails

For description see Baker, E. C. S., 1926, FBI 3: 254; Van Tyne, J. & Berger, A. J., 1959: 528; Voous, K. H., 1964, article 'Wagtail' in Thomson, A. L. (ed.), *A New Dictionary of Birds*, London & New York.

Plate 97, fig. 8

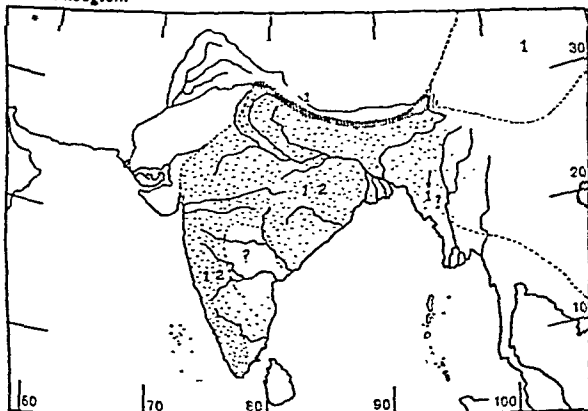

LOCAL NAMES. *Musarichi* (Hindi); *Dhan chidi* (Gujarati); *Muchassi* (Bengali); *Ambel-serui* (Munda); *Liku jitta* (Telugu); *Pūlkirūvi* (Tamil).

SIZE. Sparrow ±; length c. 15 cm (6 in.).

FIELD CHARACTERS. Above, greenish brown streaked with darker brown. Supercilium, double wing-bar, and outer rectrices whitish. Below, whitish to buff boldly streaked with dark brown on breast and flanks. Sexes alike.

Very similar to *A. trivialis* and not easily distinguishable from it in the field though in *trivialis* the upperparts are browner (v. greenish) and the streaks on the underparts bolder; call-notes apparently identical. *A. pratensis* has finer streaks on breast and different call-notes.

STATUS, DISTRIBUTION and HABITAT. Common summer (breeding) visitor to the Himalayas and winter visitor to the foothills and practically the entire Indian Peninsula. In summer from Dharmasala, Kangra and Kulu (Whistler, JBNHS 31: 474 and *Ibis* 1926: 735) east along the Himalayas to Burma, breeding c. 2700 to timber-line and in the scrub zone above it: in Kulu up to 3300 m, in central and eastern Nepal up to 4500 m (Smythies), in Sikkim

244

MOTACILLIDAE

and Arunachal Pradesh up to c. 4000 m. Affects grass and bracken-covered slopes, rocky ground and glades in open forest of oak, fir, pine, etc., abandoned cultivation and scrub with isolated trees; also dwarf juniper or other scrub just above timber-line. Winters from c. 2000 m, occasionally 2500 m (Nepal), down to the foothills and in most of the Indian Peninsula, west to Kangra and Mt Abu, east throughout Assam and Bangladesh, and south to the Ashambu Hills (southern tip of the Peninsula). In the south winters mostly in the hills up to the summits — common in coffee and cardamom plantations — and, unlike *A. trivialis*, does not seem to occur outside the evergreen woodland or in the lowlands. In the north commonly found in the plains in mango groves and suitable wooded biotope.

Extralimital. Ranges north and east to Kansu, Korea and Japan. Winters south to the Philippines and the Indochinese countries. Probably breeds on Mt Victoria (Stresemann & Heinrich, 1940).

MIGRATION. Occurs in winter quarters from September to early May (Himalayas) or mid October to mid April (southern India). Noted on migration up to 5000 m (Mt Everest).

GENERAL HABITS. Keeps singly or in pairs in summer when very territorial; in loose flocks in the non-breeding season. Runs about on the ground in search of food, flying up into trees when disturbed. Flight jerky and undulating, characteristic of all pipits and wagtails.

FOOD. Insects and their larvae, grass- and weed seeds and other vegetable matter; grit. Insects identified among stomach contents in an intensively cultivated tract in Bihar included a large proportion of weevils (especially *Tanymecus* and *Myliocerus* spp.) and other coleopterous and hemipterous remains (Mason & Lefroy, 1912).

VOICE and CALLS. Song lark-like in character sometimes similar to that of *A. trivialis*, sometimes remarkably different, with a harsher and more wheezy tone (GD); almost invariably uttered on the wing, the bird rising a short distance in the air on quivering wings from a tree-top and volplaning back to its perch with wings and tail outspread. Song period mid March till third week of June (Proud, GD). Call-note, a single *tsiep* from time to time, especially in flight, and continually repeated when alarmed (near nest).

BREEDING. Season, May to end of July. Two broods are reared though not all birds appear to be double-brooded. Nest, a cup of moss and dry grass lined with fine grass and a few hairs, placed on the ground usually under a tuft of grass occasionally under a boulder. Eggs, normally 4, less often 3 or 5, dark brown densely spotted with darker colour, occasionally pale grey blotched with dark grey-brown. Average size of 120 eggs 21.4 × 15.8 mm (Baker).

MUSEUM DIAGNOSIS. Above, olive-green with green edges to wing and tail and blackish streaking on head and mantle varying from very light to heavy. Below, white with dark, broad, well-defined streaking variable in extent. Hind claw short and curved. First three primaries longest and subequal, the fourth 1-4 mm shorter. Second, third and fourth primaries emarginated. Tail-pattern slightly off-white, with the pattern on the second outer rectrix in the form of a small spot or triangle near the tip, sometimes extending about 25 mm up the shaft.

Green edges to wings and green on upperparts distinguish *hodgsoni* from all other pipits except *A. roseatus* in autumn plumage. The two species can best be distinguished

PIPITS AND WAGTAILS

249

tail up and down, less vehemently than wagtail. When disturbed flies up into the branches of trees. Flight undulating, very like a wagtail's.

FOOD. Insects and grass- and weed seeds. A flock observed eating nectar from flowers of *Erythrina suberosa* just prior to emigration (end March), the specimens collected being excessively fat (SA).

VOICE AND CALLS. Call-note, a single *teeep* chiefly given in flight; this also repeated persistently and monotonously when bird alarmed at intruder's proximity to its nest. Song: in breeding season male sings from perch on tree-top or prominent rock — a rapid, rather lark-like *chikchikchik* . . . *chia-chia-chia-wich-wich-wich*. This frequently followed by an upward spring in a narrow arc, the bird volplaning steeply, wings stiffly outstretched and motionless, legs dangling and tail cocked far forward — accompanied by a prolonged *tee-tee-tee* . . . , back to the same or a different perch, the *tees* slowing down towards the end.

BREEDING. Season, May to end of July. Nest, a cup of grass stems lined with finer grass and a few hairs placed in a little depression under a tuft of grass, under a stone on a hillside or protected by a bush or weed. Eggs, 3 or 4, pale pinkish red, blotched or freckled with darker red and purple brown with pale lavender secondary blotches. For further details see *Nidification* 3: 139. Average size of 30 eggs 21.2 × 16 mm (Baker); of 3 eggs 19.3 × 15.2 (BBO).

MUSEUM DIAGNOSIS. Differs from nominate race (1854) in the more earthy, less olive-fulvous brown of the upperparts, paler fulvous of breast and flanks, slightly heavier streaking of the breast and broader, deeper bill. Colour of upperparts and amount of buff on underparts very variable. Some Himalayan birds are very greyish above in fresh plumage but when a little worn, as in May, they are indistinguishable from European birds in similar state. Most Indian birds in fresh plumage are quite unlike *trivialis*; in worn plumage the only difference is that of bill shape (HW). See 1854 for specific distinction.

Spring moult of body-feathers, central rectrices, tertials and most coverts except primary. Postnuptial moult complete. Fresh autumn and spring plumage alike, but worn spring dress greyer above and paler fulvous below.

Young, much as adult but edges of feathers of upperparts paler buffish brown, making the streaking more conspicuous on underparts, streaks almost confined to throat and pectoral region; flanks and under tail-coverts suffused with buff. Post-juvenal moult of body-feathers, lesser, median and inner greater coverts, tertials and central rectrices.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	83-94	14-16	20-22	54-66 mm
♀♀	83-91	14-16		54-63 mm

Width of bill at nostrils 5-5.5 mm

Hind claw 7-9 mm

(B. P. Hall, NBK, HW)

Weight 1 ♂ (October) 21; 3 ♀♀ (October) 23-25; 1 ♀ (June) 24 g (Paludan).

COLOURS OF BARE PARTS. Iris brown. Bill: upper mandible and tip of lower horny brown; rest of lower mandible flesh colour; mouth pale pink. Legs and feet brownish flesh.

- 3 Darkest and more heavily streaked. *A. n. malaysiensis* 255

1857. Richard's Pipit. *Anthus novaeseelandiae richardi* Vieillot

Anthus richardi Vieillot, 1818, Nouv. Dict. d'Hist. Nat. 26: 491 (France)

Baker, FBI No. 1193, Vol. 3: 288

Plate 97, fig. 1

LOCAL NAMES. *Rūgail*, *Chārchāri* (Hindi); *Siriām*, *Serai*, *Chanchir* (Chota Nagpur); *Gerepe-rodi-fitta* (Telugu); *Pulla parake*, *Nettai-kali* (Tamil); *Chatuppen*, *Veramben* (Malayalam); *Gomeritta* (Sinhala).

SIZE. Sparrow; length c. 17 cm (6½ in.).

FIELD CHARACTERS. A strikingly long-legged pipit similar to the Indian Paddyfield Pipit (1859, q.v.) but larger.

STATUS, DISTRIBUTION AND HABITAT. Widespread but local and erratic winter visitor; common from Bengal eastwards, uncommon in the Indian Peninsula. Recorded from the Nepal terai (Rand & Fleming 1957) and the Kathmandu Valley (Scully); south in the Peninsula to Kerala, Tamil Nadu and Sri Lanka (plentiful in the lowlands). In India normally east of a line Fatchgarh to Goa but also recorded in Kohat (Whitehead, *Ibis* 1909: 243); eastwards through Bengal, Bhutan, Assam, Manipur and Bangladesh. Also the Andaman Islands (Hume). Affects cultivation, stubble fields, bare hillsides and sandy areas; shows a marked preference for damp grassy ground — jheel margins etc.

Extralimital. Breeds from western Siberia east to Korea and the Sea of Okhotsk.

The species *novaeseelandiae* ranges through China, the Indochinese countries, Malaysia, Indonesia, the Philippines, New Guinea, Australia, New Zealand and Africa south of the Sahara. Only the Palaearctic subspecies are regular migrants and winter in southern China, the Philippines and Indochinese countries.

MIGRATION. Occurs in winter quarters from October (earliest 10 Oct.) to April or early May (latest 22 May).

GENERAL HABITS. As in 1859.

FOOD. Beetles and other insects and larvae.

VOICE AND CALLS. Usual note a loud, rapid and harsh *reep* ('r-r-rūp' — Witherby), apparently unlike that of resident subspecies (1859, q.v.). A soft double chirp strongly reminiscent of the note of a bunting (Brooks).

BREEDING. Extralimital.

MUSEUM DIAGNOSIS. Differs from the resident Indian subspecies in being larger with a longer tarsus. (See Measurements.)

250

MOTACILLIDAE

1856. Meadow Pipit. *Anthus pratensis* (Linnaeus)

(*Alenda*) *pratensis* Linnaeus, 1758, Syst. Nat. ed. 10, 1: 166 (Sweden)

Anthus pratensis emigmaticus Zarudny, 1909, Orn. Monatsb. 17: 56

(Taschkent, Turkistan)

Baker, FBI No. 1185a, Vol. 8: 661

Plate 97, fig. 5

LOCAL NAMES. None recorded.

SIZE. Sparrow ±; length c. 15 cm (6 in.).

FIELD CHARACTERS. Above, olive-brown streaked with dark brown. Two pale wing-bars. Outer edge of tail white. Below, buff with dark brown streaks on sides of throat, breast and flanks. Sexes alike.

Very similar to tree pipits but generally more buffish. In the field only distinguishable by call-notes (q.v.).

STATUS, DISTRIBUTION AND HABITAT. Scarce winter visitor to N.W.F.P. (Bannu and Kohat — *Ibis* 1909: 242; JBNHS 18: 684), the Vale of Kashmir (one record: *Ibis* 1927: 403) and Ferozepore (*Ibis* 1869: 355). Affects grassy farming areas.

Extralimital. Breeds in Europe from the Ob river to France and the British Isles. Winters in the Mediterranean and Middle East countries, Pakistan being the easternmost limit of its winter range.

MIGRATION. Recorded within our limits from 12 January to 19 March.

GENERAL HABITS. In winter usually seen in small loose flocks, often in company with *A. spinoletta*, feeding on lawns, and in meadows and lucerne fields.

FOOD. Insects and their larvae, spiders, occasionally weed seeds.

VOICE AND CALLS. When flushed usually utters some thin notes very similar to the Water Pipit's *ist* but given in series of 3 or 4 (MD).

BREEDING. Extralimital.

MUSEUM DIAGNOSIS. Above, olive-brown with clear streaking on head and mantle. Below, white or light buff with spotting on breast dark and well defined, changing on lower breast and flanks to sparse streaks. Hind claw fairly long and weak. First three primaries longest and equal, fourth usually less than 1 mm shorter, occasionally 2 mm. Second, third and fourth emarginated. Tail-pattern white with a small triangle, spot or streak near tip of second outer rectrix. Primaries and rectrices sometimes rather pointed (B. P. Hall).

For distinction from *A. trivialis* see 1854.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail

Hind claw ♂♂ 14-27, ♀♀ 14-19 mm

(HW, SA, B. P. Hall, SDR)

Weight 1 ♂, 1 ♀ Bhutan (Sept.) 27, 27 g — SDR.

COLOURS OF BARE PARTS. Iris brown. Bill horny brown, paler on lower mandible except tip; mouth yellow to pale flesh. Legs, feet and claws brownish flesh; soles chrome-yellow. Legs and feet not so fleshy in colour as those of *A. n. rufulus* and *A. godkessii*, but are more yellowish, particularly the soles (Brooks).

1858. Northwestern Paddyfield Pipit. *Anthus novaeseelandiae waiti* Whistler

Anthus rufulus waiti Whistler, 1936, J. Bombay nat. Hist. Soc. 38: 766

(Jhelum, Punjab)

Baker, FBI No. 1195 (part), Vol. 3: 290

LOCAL NAMES. *Rūgail*, *Chārchāri* (Hindi); *Dhār chidi* (Gujarati).

SIZE. Sparrow ±; length c. 15 cm (6 in.).

FIELD CHARACTERS. As in 1859, q.v.

STATUS, DISTRIBUTION AND HABITAT. Fairly common resident, subject to local movements; mostly a summer visitor to the Himalayan foothills. Pakistan from Kohat and Punjab to Quetta and Sind, and northwestern India east to U.P. from the Himalayan foothills (up to c. 1000 m, locally 1800 m, exceptionally 3000 m — Whistler, *Ibis* 1925: 189), south through Haryana, Uttar Pradesh, Rajasthan, Gujarat and Madhya Pradesh to the Narbada river. Affects grassland, stubble fields, abandoned land and marshy ground.

Extralimital. Has been obtained at Kandahar in summer.

GENERAL HABITS, FOOD AND VOICE. As in 1859.

BREEDING. Season, March to end of July. Nest and eggs, as in 1859.

MUSEUM DIAGNOSIS. Differs from *rufulus* (1859) in being paler, greyer and less heavily streaked both above and below. Differs from *richardi* by smaller size and shorter tarsus.

May be confused with first-winter birds and some adults of *A. campestris* which have retained some spotting on breast and have the same tail-pattern and wing-formula; *campestris* is identified by relatively short tarsus, long wing, shorter and

Anthus novaeseelandiae

1 *waitiei* (1858)

2 *rufulus* (1859)

3 *malayensis* (1860)

more curved hind claw and finer bill. The fact that measurements overlap and are ambiguous makes it difficult to identify all juveniles of *A. campestris*, *A. novaeseelandiae* and *A. godlewskii* with certainty (B. P. Hall).

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	76-86	16-17	25-28	51-58 mm
♀♀	75-82	15-17	24-27	49-56 mm
Hind claw	♂♂ 11-17; ♀♀ 12-15 mm			

COLOURS OF BARE PARTS. As in 1859.

1859. Indian Paddyfield Pipit. *Anthus novaeseelandiae rufulus* Vieillot

Anthus rufulus Vieillot, 1818, Nouv. Dict. d'Hist. Nat. 26: 494 (Bengal)

Baker, FBI No. 1195 (part), Vol. 3: 290

Plate 97, fig. 2

LOCAL NAMES. *Rūgail*, *Chārchāri* (Hindi); *Suriām*, *Serwi*, *Chanchir* (Chota Nagpur); *Gurapa-modi-pitta* (Telugu); *Pulla purake*, *Nettai-kali* (Tamil).

SIZE. Sparrow ±; length c. 15 cm (6 in.).

FIELD CHARACTERS. An exact miniature of Richard's Pipit and usually shorter on the legs. Above, dark brown marked with fulvous. Tail dark brown with white outer rectrices conspicuous in flight and when alighting. Below, buff streaked with brown on breast. Sexes alike.

PIPITS AND WAGTAILS

255

Differs from *richardi* (1857) in being paler and smaller; from *waitiei* (1858) in being darker and browner; from *malayensis* (1860) in being less rufous and less heavily streaked. Some individuals of *A. campestris* have a streaked breast but can usually be identified by shorter hind claw.

A partial moult takes place haphazardly throughout the non-breeding season (B. P. Hall). A complete postnuptial moult in August and September (GD, HW). Young has scalloped plumage, with rather darker and heavier spotting on breast than adult.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	78-88	15-17	24-28	54-65 mm
♀♀	74-85	15-17	25-26	51-66 mm
Hind claw	♂♂ 10-18; ♀♀ 11-16 mm			

(HW, BB, B. P. Hall)

Weight 9 ♂♂ (March-Sept.) 20.1-22.7; 6 ♀♀ (March-Sept.) 17.4-22 g (GD, SDR).

COLOURS OF BARE PARTS. Iris brown. Bill: upper mandible dark horny, paler on edges and tip; lower mandible fleshy with yellowish tinge on base and smoky on tip. Legs and feet yellowish fleshy; claws horny; soles pale yellow.

1860. Malay Paddyfield Pipit. *Anthus novaeseelandiae malayensis* Eyton

Anthus Malayensis Eyton, 1839, Proc. Zool. Soc. London: 104 (Malaya)

Baker, FBI Nos. 1195 (part) and 1196, Vol. 3: 290, 292

LOCAL NAMES. *Chatuppan*, *Varamban* (Malayalam); *Nettai-kali* (Tamil); *Gomaritta*, *Panu-kūrulla* (Sinhala).

SIZE. Sparrow ±; length c. 15 cm (6 in.).

FIELD CHARACTERS. As in 1859, q.v.

STATUS, DISTRIBUTION AND HABITAT. Common resident. Kerala and Sri Lanka, in the plains and hills up to c. 1800 m (Kerala) and 2100 m (Sri Lanka). Affects ploughed and stubble fields, sparse grass-covered fallow land, neighbourhood of backwaters and irrigation tanks, grazing grounds and grassy slopes and summits of hills, particularly where sheet rock and boulders occur. More or less replaced by *A. nilghiriensis* in the hills though both species may be seen side by side.

Extralimital. Malaysia, Sumatra, Java, Borneo and the southern Indochinese Peninsula. For range of the species see 1857.

GENERAL HABITS AND FOOD. As in 1859.

VOICE AND CALLS. Utters a sharp *twit*, *twit-tit* in flight (Henry). For description of song see 1859.

BREEDING. Season, November to May in Kerala, January to July in Sri Lanka, with a peak in April-May. Apparently single-brooded. Nest and eggs, as in 1859. For details see also Phillips, 1950, *Ceylon Jour. of Sci.* 24: 76-8. Female only appears to build the nest while male keeps watch, but the latter may assist in incubation (Phillips).

MUSEUM DIAGNOSIS. Differs from *rufulus* (1859) in being darker and more heavily streaked. Postnuptial moult complete, August to October.

A. campestris usually has unstreaked underparts though some individuals are lightly streaked on breast. Call-notes very different.

STATUS, DISTRIBUTION AND HABITAT. Common resident, subject to local movements. India east and south of the range of *waitiei* (excepting Kerala), the Nepal Valley, terai and duns, Jalpaiguri duars, Bhutan foothills to c. 1800 m, Bangladesh and Assam. In Nepal breeds locally up to c. 2100 m. Withdraws from higher levels in winter when occurring from c. 1000 m down. Passes through in Sikkim and Nepal in autumn below c. 2000 m (see Diesselhorst, 1968: 361). Affects open grass and stony country, fallow fields, low dry crops, edges of cultivation, roadsides and, locally, village grazing grounds.

Extralimital. Ranges east through Burma, Thailand, northern Vietnam and southern China. For range of species see 1857.

GENERAL HABITS. Keeps in pairs or small loose flocks according to season. Feeds on the ground, running about briskly and moving its tail up and down in the manner of wagtails; flight also similarly undulating. Perches freely on bushes and tufts of grass.

FOOD. Insects and their larvae. Identified among stomach contents are weevils (*Myliocerus* sp.), ants (*Phidole malinsi*, *Crematogaster subnuda*), termites (*Termes* sp.), Hemipterous bugs, spiders, weed seeds, grass blades and other vegetable matter (Mason & Lefroy, 1912).

VOICE AND CALLS. Song consists of a wheezy trill or feeble *tseep* notes uttered as the bird rises in the air in an ascending succession of dipping curves; when arrived at the highest point dives to earth in an abrupt curve with stiff, partly extended wings (HW). Also described as a series of five to twenty *clink* notes often given in flight (Nichols). Ordinary call-note a thin high-pitched *pipit* or *tseep-tseep* (SA). Concern for nest and young expressed by a feeble *tsip-tsip-tsip* etc. as parent flies flutteringly a few metres above intruder, sailing down to the ground on stiff half-closed wings and uptilted tail looking like a child's paper aeroplane. This manoeuvre repeated again and again.

BREEDING. Season, the dry months from November till the break of rains in June in the south, March to July in the north, occasionally till September (Bengal). Nest, a cup of grass and grass roots neatly lined with fine grass and hair, sometimes partly domed; usually placed among roots of grass tufts, tangles of weeds, etc. in a fallow field or grazing land, often in a small depression such as a sunbaked hoof-print of cattle. Eggs, 3 or 4, usually 3 in the south, pale grey or buff marked with blackish brown speckles and secondary ones of grey: Average size of 125 eggs 20.2 × 15.4 mm. Brood-parasitized by *Cuculus canorus*. Building of nest and care of young by both sexes. Parents usually approach the nest through a tunnel in the grass, 30 to 60 cm long. Injury-feigning by female flushed from nest has been observed.

MUSEUM DIAGNOSIS. Hind-claw medium or long, comparatively weak and often rather straight. First three primaries (as) longest and subequal, with the fourth slightly shorter. Fifth primary about 7-10 mm shorter than fourth. Second, third and fourth emarginated. White pattern on inner web of second outer rectrix usually in the form of a narrow streak up more than half the shaft, only slightly wider at the tip

256

MOTACILLIDAE

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	77-87	16-18	24-28	51-62 mm
♀♀	74-84	16-18	24-28	50-60 mm
Hind claw	♂♂ 12-18; ♀♀ 12-18.			

(HW, B. P. Hall, SA)

COLOURS OF BARE PARTS. Iris brown. Bill: upper mandible and tip of lower horny brown, rest of lower mandible pale flesh colour; gape yellow; mouth orange-yellow, bright yellow or yellow and pink, varying with age. Legs and feet brownish yellow, claws dusky.

ANTHUS CAMPESTRIS (Linnaeus)

Key to the Subspecies

Darker and larger; wing mostly over 90 mm. *A. c. campestris*
Paler and smaller; wing mostly 90 mm or under *A. c. kastschenkoi*

(Tischan, Turkestan)

Baker, FBI Nos. 1197 (part) and 1198, Vol. 3: 292, 293

Plate 97, fig. 3

LOCAL NAMES. *Chillu* (Hindi); *Dhan chidi* (Gujarati).

SIZE. Sparrow ±; length c. 15 cm (6 in.).

FIELD CHARACTERS. Above, pale brown, lightly streaked. Outer rectrices white. Below, plain whitish buff, sometimes with dark streaks on breast. Sexes alike.

Absence of streaking on underparts distinguishes this species from *A. novaeseelandiae*. Some individuals however may have a streaked breast; best identified by call-notes (q.v.). *A. similis* is a larger bird with a relatively longer tail and different call-notes.

In flight silhouette easily confused with Grey-necked Bunting (2050) with which it is often associated.

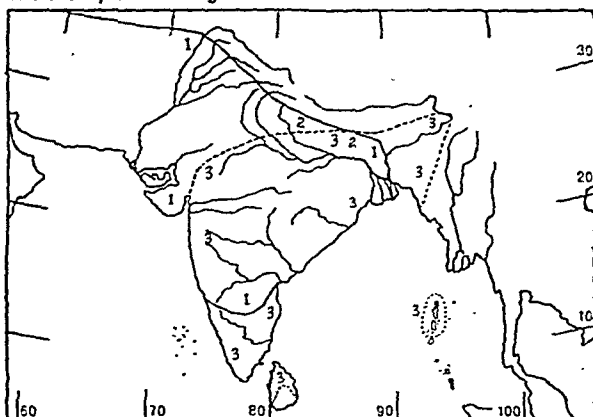

STATUS, DISTRIBUTION AND HABITAT. Winter visitor, widespread and locally very common. Pakistan from Kohat and Punjab south through Sind (JBNHS 66: 26) and Baluchistan, and the greater part of the Indian Peninsula east to the Brahmaputra river in Bangladesh (Rashid, 1967) and south to Londa near Belgaum (Koel, JBNHS 43: 22) and the Kolar district, extreme southeastern Karnataka (Sālim Ali, JBNHS 43: 587); in the north to base of the hills in Kangra, Simla and Dehra Dun. Not recorded from Nepal. Affects open, sparsely scrubbed stony country, semi-desert, fallow land, pastures and ploughed fields.

Extralimital. Breeds from Mongolia, Turkestan and northeastern Afghanistan west to France and Morocco. Winters in the Middle East countries, northeastern and northern Africa.

PIPITS AND WAGTAILS

257

Anthus campestris and A. godlewskii

Winter ranges

Solid line : 1 *A. c. campestris* (1861) 2 *A. c. kastschenko* (1862)
 Broken line : 3 *A. godlewskii*

MIGRATION. No ringing data. Arrives in winter quarters mostly in September; two records in July and one on 19 June (Sambhar) are exceptional. Remains till mid April (latest 14 May). Common on passage in the plains of northwestern India and Pakistan. There is but one record from the ranges to the north, Gilgit 8 March.

GENERAL HABITS. Keeps singly, in scattered twos and threes, or loose flocks. Feeds on the ground; frequently jumps up a few centimetres to take an insect from a herb.

FOOD. Insects (weevils, *Tanymecus indicus* identified) and weed-seeds.

VOICE AND CALLS. Not recorded within our limits. Extralimital, a distinctive sparrow-like *tsirip* or *tsirih* usually uttered in flight.

BREEDING. Extralimital.

MUSEUM DIAGNOSIS. Above, light or tawny brown, indistinctly streaked on head and mantle in adult. Below, pale buff with little or no spotting on breast in adult. Hind claw short to medium, curved and moderately strong. First three primaries (as.) longest and subequal, the fourth slightly shorter; fifth about 10 mm shorter than fourth. Second, third and fourth emarginated. White pattern on second outer rectrix usually in the form of a long narrow streak up the shaft, only slightly wider at the tip; sometimes reduced to a short streak near tip.

Young has scalloped plumage, distinctly streaked above and on breast.

Plainer back and plain breast of most specimens identify this species. However, first-winter birds and some adults which have retained some spotting on breast are not easily distinguishable from some *A. novaeseelandiae* which have a similar

Corydalla (*A.*) *thermophilus* 'Hodgson' = Jerdon, 1863, Bds. India 2: 233 (name only)

Agrodroma Godlewskii Taczanowski, 1876, Bull. Soc. Zool. France: 158 (Argun River, south Dauria)

Cf. Kinnear, N. B., in Ludlow & Kinnear, 1944, *Ibis* 86: 364

Baker, FBI No. 1194, Vol. 3: 289

LOCAL NAMES. *Chillu* (Hindi); *Palla puraki* (Tamil); see also 1859.

SIZE. Sparrow \pm ; length c. 15 cm (6 in.).

FIELD CHARACTERS. Not distinguishable from *A. novaeseelandiae* (1857 and 1859, qq.v.) unless in the hand, but see Voice and Calls. Distinguished from *A. campestris* by streaked breast.

STATUS, DISTRIBUTION AND HABITAT. Widespread and locally common winter visitor. Assam, Bangladesh and most of the Indian Peninsula west to Fatehgarh (near Agra) and Udaipur (southeastern Rajasthan), and south to Nellore, Karnataka (up to 750 m in the hills) and Kerala (uncommon in southern India). Also Sri Lanka (Phillips, *Spolia Zeylanica* 28: 188; JBNHS 51: 937) and Andaman Islands (one record). Reported nesting in 'Assam' (JBNHS 10: 3, 16: 72 and 17: 962, SF 11: 236, FBI 3: 290 and *Nidification* 3: 145), on high ridges between 1600 and 2000 m. Baker states that he 'never found *A. n. rufulus* breeding on these high ridges though the bird was exceedingly common on the lower hills and up to 5000 feet' (1500 m). Data require confirmation. Specimens have been obtained at Sadiya on 5 June (Hume coll.), and Deju on 20 July (Stevens). These records fall within the migration period of the species, but may be an indication of not too distant breeding grounds. In winter affects dry paddyfields, grass and fallow land and edges of cultivation. On migration prefers swampy land.

Extralimital. Breeds in eastern Asia from central Mongolia to eastern Manchuria south to Ala Shan and Tibet. Breeding range apparently complementary to that of *A. campestris*.

MIGRATION. Autumn passage recorded from August to the end of October in southeastern Tibet, Bhutan, Sikkim and Nepal (see Diesselhorst, 1968); on Mt Everest up to 6000 m. Occurs in winter quarters from early September to 20 July in 'upper Assam' (Stevens, JBNHS 23: 267) to end of April or early May. A specimen has been collected in the Sutlej Valley in June (Hume coll.).

GENERAL HABITS AND FOOD. As in 1861. Display described in *Nidification* 3: 146; very similar in general pattern to that of Paddyfield Pipit (1859), q.v.

VOICE AND CALLS. Indistinguishable in voice and behaviour from *A. n. richardi* (Schäfer); different from voice of *A. n. rufulus* and peculiarly harsh (Diesselhorst). 'Rises with a loud and discordant note; and by the note alone it is easy to distinguish this species, so utterly unlike is it to that of any other pipit' (Brooks, SF 1: 359).

MOTACILLIDAE

258

wing formula and tail-pattern. Best guides to identification are the relatively short tarsus and long wing of *A. campestris*, and its shorter and more curved hind claw and finer bill.

Moult very variable. A spring moult of body-feathers, tertials, median coverts, sometimes all greater and lesser coverts, central rectrices or whole tail. A haphazard winter moult of some body-feathers, wing-coverts, innermost secondaries and central rectrices. Some birds, both adult and young, arrive in winter quarters before the moult is completed. Postjuvinal moult includes body-feathers, most wing-coverts except primary, usually tertials and central rectrices.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	88-101	18-20	25-28	61-76 mm
♀♀	82-91	17-20	24-26	59-69 mm

Hind claw ♂♂ 10-13; ♀♀ 9-14 mm, rarely over 11 mm

(B. P. Hall, HW)

Weight 12 ♂♂ (Mar.-Apr.) 17-22 (av. 19) g — SA. 2 ♂♂ (Sept.) 22, 25; 2 ♀♀ (Sept.-Oct.) 19, 23.5 g — Paludan, Afghanistan.

COLOURS OF BARE PARTS. Iris dark brown. Bill: upper mandible dark brown, lower pinkish flesh. Legs and feet yellowish flesh; claws dusky.

1862. Siberian Tawny Pipit. *Anthus campestris kastschenko* Johansen

Anthus campestris kastschenko Johansen, 1952 (1944), Jour. f. Orn. 92: 147

(Novosibirsk, West Siberia)

Baker, FBI No. 1197 (part), Vol. 3: 292

LOCAL NAMES. None recorded.

SIZE. Sparrow \pm ; length c. 15 cm (6 in.).

FIELD CHARACTERS. As in 1861, q.v.

STATUS, DISTRIBUTION AND HABITAT. Winter visitor in Uttar Pradesh and Bihar. Habitat as in 1861.

Extralimital. Breeds in western Siberia.

GENERAL HABITS, FOOD AND VOICE. As in 1861.

MUSEUM DIAGNOSIS. Differs from nominate race (1861) in being paler and smaller.

MEASUREMENTS

COLOURS OF BARE PARTS. As in 1861.

MOTACILLIDAE

260

BREEDING. See Baker, *Nidification* 3: 145 for data possibly pertaining to this species.

MUSEUM DIAGNOSIS. Above, tawny brown clearly streaked on head and mantle. Below, pale buff, the upper breast streaked with dark brown. Hind claw of medium length and comparatively weak. First three primaries (as.) longest, and subequal, fourth slightly shorter; fifth about 10 mm shorter than fourth; second, third and fourth emarginated. White pattern on second outer rectrix a triangle, broad at the tip and usually about 15 mm, occasionally reduced further but always retaining a triangular shape rather than appearing as a streak along the shaft.

A haphazard winter moult and a partial spring moult similar to those of Richard's Pipit.

Young has scalloped plumage. Spotting on breast slightly denser and darker than in adult but less well-defined.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	90-97	16-18	25-28	62-70 mm
♀♀	84-93	16-18	24-27	59-69 mm

Hind claw ♂♂ 11-17; ♀♀ 11-17 mm, rarely over 14 mm

(B. P. Hall, NBK)

Weight 1 ♂ (Sept.) 24.7; 4 ♀♀ (Sept.) 25.1-30.5; 2 ♀♀ imm. (Sept.) 22.7, 24.9 g (GD).

COLOURS OF BARE PARTS. Iris dark brown. Bill flesh colour, dusky on upper mandible and tip of lower; gape and mouth bright yellow or pinkish flesh. Legs and feet yellowish.

1864. Redthroated Pipit. *Anthus cervinus* (Pallas)

Motacilla cervina Pallas, 1811, Zoogr. Rosso-Asiat. 2: 511 (Siberia)

Baker, FBI No. 1199, Vol. 3: 294

Plate 97, fig. 6

LOCAL NAME. *Lāl gālā chillu* (Hindi).

SIZE. Sparrow \pm ; length c. 15 cm (6 in.).

FIELD CHARACTERS. Above, pale brown, heavily streaked with dark brown. A buffish supercilium and double whitish wing-bar. Outer rectrices white. Below, creamy buff streaked with dark brown on breast, sides of neck and flanks, the throat either whitish or with some pinkish clay colour. In spring, males have the supercilium, throat and upper breast pinkish clay with little or no streaking on breast. Sexes alike.

A. roseatus in summer plumage has a more conspicuous whitish supercilium, vinaceous buff throat, this colour extending to upper belly. *A. trichialis*, *A. hodgsoni* and especially *A. pratensis* are confusingly similar to *A. cervinus* in autumn plumage and are not distinguishable in the field except maybe by their call-notes.

STATUS, DISTRIBUTION AND HABITAT. Very scarce passage migrant, mostly in Pakistan: Lower Sind from 27 October to 20 November and 4 March to 4 May (fairly common — Ticehurst, *Ibis* 1923: 10); Baroda (Gujarat) 18 November (Sálim Ali, JBNHS 52: 777); Gilgit 1500 m, 21 and 22 October and Kiswand 20 June (Biddulph, specimens in Brit. Mus.); also Gilgit in

PIPITS AND WAGTAILS

261

May and December (Biddulph, *Ibis* 1882: 270); Sutlej Valley in June (Hume, SF 2: 241, specimen in Brit. Mus.); Manipur in April (Hume, SF 11: 237); central Nepal 5100 m in December (belated migrant?) (Rand & Fleming 1957); Maldives Islands in December and probably earlier as an autumn passage migrant (Phillips, JBNHS 60: 582). A winter visitor to the Andaman and Nicobar islands (Hume & Davison, Osmaston). Other records should be regarded as mislabeled (e.g. Sikkim in July) or misidentified. Affects low grass on wet ground, and stubble fields.

Extralimital. Breeds in the tundra from northern Scandinavia to the Chukotski Peninsula. Winters in the northern half of Africa and in lower Burma, the Indochinese countries, Hainan, Borneo, Celebes, and the Philippines.

GENERAL HABITS. Usually seen in small, loose flocks on damp or marshy ground. Does not perch on bushes or trees.

FOOD. Insects.

VOICE AND CALLS. A hoarse *teez*, a clear *pee-ee* and a soft *teu* (Witherby).

MUSEUM DIAGNOSIS. See Field Characters. Birds lacking rufous tinge on throat are easily distinguished from other small-size pipits by dark centres on upper tail-coverts. For details of plumage see B. P. Hall, 1961.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	83-90	14-15	21-22	49-56 mm
♀♀	79-87			47-55 mm

(B. P. Hall, CBT)

Tail of one ♂ 65 mm (SA)

COLOURS OF BARE PARTS. Iris brown. Bill horny brown, yellowish at base, darker at tip. Legs and feet fleshy brown; soles pale yellow.

1865. **Vinaceousbreasted Pipit.** *Anthus roseatus* Blyth

Anthus roseatus Blyth, 1847, Jour. Asiat. Soc. Bengal 16: 437 (Nepal)

Anthus pelopus G. R. Gray, 1846, Cat. Mamm. Bds. Nepal: 154 (Nepal)

[nomen nudum]

Baker, FBI No. 1200, Vol. 3: 295

Plate 97, fig. 7

LOCAL NAMES. None recorded.

SIZE. Sparrow ±; length c. 15 cm (6 in.).

FIELD CHARACTERS. Summer plumage. *Above*, grey with dark brown streaks. A distinct buff supercilium. Wings brown with greenish edges and two pale wing-bars. Tail brown with whitish outer edges. *Below*, throat and breast a delicate pink or vinaceous buff with a few faint streaks on breast. Rest of underparts buffish, the flanks streaked with dark brown. Sexes alike.

Autumn plumage. *Above*, olive-brown instead of grey. Supercilium often tinted yellow. *Below*, vinaceous on throat and breast fainter, the breast heavily streaked.

Immature birds lack any vinaceous colour and are indistinguishable from *A. hodgsoni*.

STATUS, DISTRIBUTION AND HABITAT. Common summer (breeding) visitor to the Himalayas from the Safed Koh, Baltistan and Ladakh (Dcosai plain)

PIPITS AND WAGTAILS

263

than that of *A. spinoletta* and reminiscent of the Woodlark's (Desfayes); also said to be reminiscent of that of the Redwinged Bush Lark. Song also uttered on the ground, in which case only the first twittering part is given (Schäfer). Song period, beginning of May to end of July (Proud, GD).

BREEDING. Season, end of May to August, sometimes September. *Nest*, a cup of grass lined with finer grass and some hair placed in a little depression apparently scraped by the bird, under a rock or a tuft of grass. *Eggs*, 4, sometimes 3, grey or brownish buff, very densely and finely speckled with shades of colour ranging from sepia to chocolate-brown. Average size of 100 eggs 22 × 15.6 mm (Baker). Sometimes brood-parasitized by cuckoos, e.g. *Cuculus saturatus*.

MUSEUM DIAGNOSIS. Axillaries lemon-yellow. First four primaries (as) longest and subequal. Second, third and fourth emarginated. Tail-pattern slightly off-white, pattern on second outer rectrix confined to a medium or small triangle near tip. Complete postnuptial moult in August-September. A moult of body-feathers, tertials, innermost greater coverts and central rectrices between December and March.

Young, similar to adult in autumn but browner above and less heavily streaked below, with no streaking on the abdomen. Postjuvénal moult of body-feathers, lesser, median and ? greater coverts.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	84-96	15-17	22-24	57-69 mm
♀♀	79-87	15-16		52-64 mm

(B. P. Hall, BB, Stres.)

Weight 9 ♀♀ (Mar.-Apr.) 17-20 g — SA. 13 ♂♂ (July-Sept.) 19-25; 6 ♀♀ (July-Sept.) 19-23 g (GD, SDR).

COLOURS OF BARE PARTS. Iris dark brown. Bill blackish. Legs and feet brownish flesh.

D	Darkest above, underparts cinnamon rather than buff.....	<i>A. s. travancoriensis</i> 267

1866. **Persian Rock Pipit.** *Anthus similis decaptes* Meinertzhagen

Anthus sordidus decaptes Meinertzhagen, 1920, Bull. Brit. Orn. Cl. 41: 23

(Rud-i-Taman, East Persia)

Baker, FBI No. 1192, Vol. 3: 287

LOCAL NAMES. None recorded.

SIZE. Bulbul; length c. 20 cm (8 in.).

FIELD CHARACTERS. As in 1867, q.v.

STATUS, DISTRIBUTION AND HABITAT. Common summer (breeding) visitor to the hills of Baluchistan (Chagai, Kalat and presumably the central

262

MOTACILLIDAE

east through Sikkim, Bhutan and Arunachal Pradesh. Breeds mostly above timber-line up to 4200 m, in Nepal 5300 m. Affects alpine meadows and boulder-strewn grassy slopes, especially about patches of melting snow and on marshy or sodden ground. Winters in the foothills (up to c. 1500 m) and in the northern parts of Pakistan (south to Sutlej-Indus confluence), India

Anthus roseatus

Distributional range

Winter

Breeding

(south to Sirsa [Haryana], Gwalior [northern M.P.] and central Bihar). Kathiawar (Bhavnagar, 21°46'N, 72°14'E. — Dharmakumarsinhji, JBNHS 50: 175). Bengal, and the whole of Bangladesh, Assam, Nagaland and Manipur. In winter largely a bird of marshes, jheels and rice-fields.

Extralimital. Breeds in the mountains of western China north to Shensi and Kansu and east to the Tarim Basin. Winters south to southern China and the northern Indochinese countries.

MIGRATION. Arrives in winter quarters in October, leaves in early April, a few being still seen in early May in the foothills. May be seen on summer grounds until November.

GENERAL HABITS. Keeps in pairs in the breeding season, otherwise in small loose flocks; young birds start flocking in the beginning of September.

FOOD. Insects, seeds (probably from berries); grn.

VOICE AND CALLS. Call-note, usually uttered when rising, a single or double note similar to that of *A. pratensis* (Schäfer), softer and less shrill than that of *A. spinoletta*. Alarm-note near nest, a single, repeated mournful squeak (Whistler). Song, usually uttered during song-flight, given in two parts, a twittering phrase while rising followed by a long series of pleasant fading notes *tu-li-tu-li-tu-li*... as the bird descends slowly towards the ground on outstretched, quivering wings; more musical and more varied

MOTACILLIDAE

264

Makran Range, Quetta district), N.W.F.P. to Kohat, and western Punjab in the Salt Range. Breeds mostly above c. 1400 m and up to 2900 m, on open grassy slopes, sometimes fairly steep, with boulders, stones or shale.

Anthus similis

Distributional ranges

1 *decaptes* (1866) 2 *jerdoni* (1867) Winter range of 1 and 2
3 *similis* (1868) 4 *travancoriensis* (1869)

Winters in the lower valleys and foothills, extending to the Makran Coast (scarce), Gujarat, Khandesh, western Madhya Pradesh, Rajasthan and Haryana. In this season frequents grassy plains, open low scrub jungle, dry watercourses, fallow land and grassy canal banks.

Extralimital. Extends west to the Zagros Mts of Iran. The species also occurs in Lebanon, southern Arabia and Africa south of the Sahara.

MIGRATION. Occurs on summer grounds from the beginning of April to mid September.

GENERAL HABITS, FOOD AND VOICE. As in 1867.

BREEDING. As in 1867. Clutch size normally 3 or 4, occasionally 5. Average size of 30 eggs 23.3 × 16.6 mm (Baker).

MUSEUM DIAGNOSIS. Differs from *jerdoni* (1867) in being paler and greyer; markings on throat and breast fainter, less numerous and paler.

MEASUREMENTS

♂♂	94-105	c. 20	80-91 mm
♀♀	95-101		80-87 mm

(H.W. SA)

Weight 1 ♂ (March) 31 g (Paludan).

COLOURS OF BARE PARTS. As in 1867.

PIPITS AND WAGTAILS

265

1867. **Brown Rock Pipit.** *Anthus similis jerdoni* Finsch

Anthus jerdoni Finsch, 1870, Trans. Zool. Soc. London 7 (4): 241
(Kotegurh, northwest Himalaya)
Baker, FBI No. 1191, Vol. 3: 286

LOCAL NAMES. None recorded.

SIZE. Bulbul; length c. 20 cm (8 in.).

FIELD CHARACTERS. A large pale brown, long-tailed pipit. Above, pale brown lightly streaked on head and back. A distinct buff supercilium. Wings and tail darker, the latter with whitish outer edge. Below, throat whitish, rest of underparts pinkish buff with faint brown streaks on breast, sometimes entirely wanting. Sexes alike.

Very similar to *A. campestris* and *A. n. rufus*, which are both markedly smaller. *A. n. richardi* is distinctly streaked with dark brown above and is higher on the legs. *A. sylvanus* is much darker and boldly streaked above.

STATUS, DISTRIBUTION and HABITAT. Common summer (breeding) visitor and partly resident, subject to vertical movements. The western Himalayan foothills from N.W.F.P. (Chitral) east to Almora, breeding between c. 600 and 1800 m, occasionally higher. Affects dry grassy and stony slopes. Winters mostly below c. 900 m, south to Gujarat and Madhya Pradesh, and east in the western Nepal terai, Bihar, northern Bengal, Sikkim foothills and northwestern Bangladesh. In winter frequents grassy plains, sparsely scrubbed country, fallow land, wheat-fields and sand dunes, etc.

EXTRALIMITAL. A disjunct population occurs in dry central Burma.

MIGRATION. See 1866. Noted in winter quarters from 5 September to 5 April.

GENERAL HABITS. Keeps singly or in pairs feeding on the ground, rising suddenly from near one's feet if unnoticed and flying to an exposed rock, mound or shrub. When flushed among standing crops, leaps a few metres up in the air and leisurely hovers in aimless zigzags before descending again into the crops a short distance away. This behaviour also frequently indulged in before sunset without provocation, and apparently just for fun. If followed up runs swiftly along the ground, taking cover behind a tuft of grass or a clod. Apparently does not wag tail. Flight rapid, strong and undulating.

FOOD. Insects and berries.

VOICE and CALLS. Call-note, a soft *plip* . . . *plip* reminiscent of that of *A. n. richardi* but louder and clearer. No song as such. Only a single note repeated at short intervals, sometimes higher, sometimes lower in tone (Osmaston), usually uttered during display which is described as a curious mounting hovering flight somewhat different from that of other pipits, there being a more frequent flapping of the wings (Jerdon).

BREEDING. Season, April to August. Nest, a shallow cup of coarse grass lined with finer grass and occasionally a small amount of hair, placed on the ground in the shelter of a tuft of grass, stone or small bush. Eggs, 3 or 4, pale grey-brown to pale green heavily marked with dark brown or grey-brown spots and blotches. Average size of 40 eggs 22.7 × 16.6 mm (Baker).

PIPITS AND WAGTAILS

267

1869. **Kerala Rock Pipit.** *Anthus similis travancoriensis* Ripley

Anthus similis travancoriensis Ripley, 1953, Postilla, Yale Peabody Mus., No. 17: 2
(Road to Muthukuzhi, Ashambu Hills, Travancore-Cochin State)
Baker, FBI No. 1190 (part), Vol. 3: 285

LOCAL NAME. *Peranirangan* (Malayalam).

SIZE. Bulbul; length c. 20 cm (8 in.).

FIELD CHARACTERS. As in 1867, q.v.

STATUS, DISTRIBUTION and HABITAT. Uncommon resident. Kerala and western Tamil Nadu from the Ashambu hills north probably to the Palni hills (cf. JBNHS 44: 405). Affects grassy and stony hillsides with rocky outcrops above c. 1000 m.

GENERAL HABITS, FOOD and VOICE. As in 1867.

BREEDING. Season, chiefly April and May. Nest and eggs, as in 1868.

MUSEUM DIAGNOSIS. Differs from *similis* (1868) in being uniformly darker above and below. Underparts cinnamon rather than buff. Edgings of outer rectrices darker, tawny olive rather than wood-brown. A larger area of dark brown on inner web of second outer rectrix.

MEASUREMENTS. As in 1868.

COLOURS OF BARE PARTS. Iris hazel brown. Bill: upper mandible dark horny brown, lower pale flesh-colour; gape yellow; mouth pinkish yellow. Legs and feet yellowish brown; claws horny brown.

1870. **Nilgiri Pipit.** *Anthus nilghiriensis* Sharpe

Anthus nilghiriensis Sharpe, 1885, Cat. Bds. British Mus. 10: 550
(Hills of Southern India = Nilgiri Hills)
Baker, FBI No. 1189, Vol. 3: 283

Plate 97, fig. 11

LOCAL NAME. *Pullian* (Malayalam).

SIZE. Sparrow ±; length c. 17 cm (6½ in.).

FIELD CHARACTERS. A dark, medium-sized pipit. Above, tawny olive with broad dark brown streaks. A buff supercilium. Tail dark brown, outer edge buffish. Below, buff streaked with dark brown on breast, upper belly and flanks. Sexes alike.

The distinct dark streaks extending to upper belly and flanks identify this pipit in its restricted range.

STATUS, DISTRIBUTION and HABITAT. Fairly common resident in the hills of Kerala and western Tamil Nadu. Breeds above c. 1500 m in the Nilgiris, Palni and High Range, and at about 1000 m in the Ponmudi hills. Affects open downs and hilltops covered with short grass. 'Coffee land a favourite haunt; rarely seen outside green woodland' (Bets, JBNHS 50: 225).

GENERAL HABITS. Keeps singly or in pairs. When flushed flies up onto nearest bush or tree.

FOOD. Insects and small seeds.

VOICE and CALLS. Unrecorded.

BREEDING. Season, April to July. Nest, a cup of coarse grass and grass-blades lined with finer grass and fine grass stems, placed among the roots of short grass, either on open hillsides or on some bank, well screened by

266

MOTACILLIDAE

MUSEUM DIAGNOSIS. First four primaries (as.) longest and subequal, fifth not more than 8 mm shorter than the fourth and usually under 5 mm shorter. Second to fifth emarginated. Tail-pattern dusky white or buff; pattern on inner web of second outer rectrix limited to a small triangle near tip. Hind claw short, curved and strong.

A complete moult about August; apparently no spring moult. Differs from *deceptor* (1866) in being darker and having more distinct spotting on breast. For distinction from *similis* see 1868.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail

♀♀	95-99			

COLOURS OF BARE PARTS. Iris dark brown. Bill dark brown. Legs and feet flesh colour.

1868. **Rufous Rock Pipit.** *Anthus similis similis* Jerdon

Anthus similis Jerdon, 1840, Madras Jour. Lit. Sci. 11: 35 (Jalna, restricted by Whistler & Kinnear, 1934, JBNHS 37: 99, vide Jerdon, 1847, Ill. Ind. Orn., pl. 45)
Anthus cockburniae Oates, 1890, Fauna Brit. India, Bds. 2: 305 (Nilgiri hills)

Baker, FBI No. 1190 (part), Vol. 3: 285

Plate 97, fig. 4

LOCAL NAMES. None recorded.

SIZE. Bulbul; length c. 20 cm (8 in.).

FIELD CHARACTERS. As in 1867, q.v.

STATUS, DISTRIBUTION and HABITAT. Uncommon resident. The Western Ghats in the Nilgiri hills, Biligirirangan and Bababudan hills (southwestern Karnataka); also known to breed near Poona (west-central Maharashtra—JBNHS 37: 98-99) and possibly Jalna (Jerdon, loc. cit. *supra*—undated but birds were displaying). A December record from Ahmednagar but subspecific identity uncertain, specimens not in existence. Affects grassy hillsides with boulder and sheet rock outcrops and stubble fields etc. from c. 1000 m up to the highest plateaux.

GENERAL HABITS, FOOD and VOICE. As in 1867.

BREEDING. Season, April to August. Nest and eggs, as in 1867. Average size of 10 eggs 22.8 × 17 mm (Baker).

MUSEUM DIAGNOSIS. Differs from *jerdoni* (1867) in being darker. Underparts darker, richer and more rufous. Markings on breast more numerous and better defined. Tail-pattern rufous instead of rufous-white. Edges of coverts more rufous. For distinction from *travancoriensis* see 1869.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail

Regional Exploration, No. 1: 21 (Korla, Kangra District, Punjab)

Baker, FBI No. 1204, Vol. 3: 299

Plate 97, fig. 12

LOCAL NAMES. None recorded.

SIZE. Bulbul —; length c. 17 cm (6½ in.).

FIELD CHARACTERS. Above, heavily streaked with pale brown and dark rufous brown. A whitish supercilium. Outer edge of tail whitish. Below, chin whitish, a short, black malar streak. Rest of underparts fulvous with dark brown shaft-streaks. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Resident, subject to vertical movements. Pakistan from the Sulaiman Range north to Kohat and east along the Himalayas at least to eastern Nepal (Fleming & Traylor, 1968). Breeds between c. 1200 and 3000 m, locally down to 900 m (Kangra), optimum zone 1200-2400 m. Withdraws from upper levels in winter (highest record 2500 m) but does not descend below c. 900 m (HW). A specimen from Etawah, U.P., mislabeled? Affects steep grassy slopes interspersed with bushes or broken up by rocky ground, abandoned terrace cultivation and open pine forest (*Pinus longifolia*) where there is abundant grass.

Extralimital. Range apparently disjunct. The species occurs again in southern China from Yunnan and Szechuan through Kwangsi, Kiangsi, Fukien and Chekiang (Cheng, 1958).

GENERAL HABITS. Keeps singly or in pairs, feeding on the ground, now and then standing quietly in a fairly erect position on a little eminence. Flicks tail quite sharply, unlike the slow wagging of other pipits (Jones).

FOOD. Unrecorded.

VOICE AND CALLS. Has a 'sawing' song of two notes repeated a half-dozen times, the stress on the first syllable: *seetyu-seetyu* ... or the reverse,

270

MOTACILLIDAE

Rajasthan (to Jodhpur, Mt Abu). Affects damp ground, marshes, grassy margins of jheels, ponds, canals, rice-fields and other irrigated cultivations.

Extralimital. Breeds in the alpine zone in the Caucasus and mountains of northern Iran, and in central Asia from the Pamirs north to the Sayan, Transbaikalia and northern Mongolia. Winters in China, the Middle East and Egypt. The species breeds in the mountains of central and southern Europe, on rocky coasts of the British Isles and Scandinavia, in the mountains of eastern Siberia, the tundra of North America and the alpine zone of western North America.

MIGRATION. First birds arrive in winter quarters in early October but most arrive in November and depart in March (latest 24 March).

GENERAL HABITS. Usually met with in small loose flocks, sometimes singly, feeding on the ground along the edge of water or in wet fields, frequently in association with Yellow Wagtails. Does not perch on trees or bushes.

FOOD. Insects.

VOICE AND CALLS. Call-note, a single or double unmusical *ist* (or *in*) uttered in flight.

BREEDING. Extralimital.

MUSEUM DIAGNOSIS. See Field Characters. First four primaries (as) longest and subequal. Second, third and fourth emarginated. Tail-pattern white; pattern on second outer rectrix usually confined to a small triangle near tip. A moult of body-feathers, tertials, median and inner greater coverts, and central rectrices from January to March.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail

♀♀	83-90			56-61 mm

(B. P. Hall)

Weight 1 ♀ (October) 18.7 g (RAP).

COLOURS OF BARE PARTS. Iris brown. Bill dark brown, fleshy at base of lower mandible. Legs and feet blackish.

1872. Japanese Water Pipit. *Anthus spinoletta japonicus* Temminck & Schlegel*Anthus pratensis japonicus* Temminck & Schlegel, 1847, in Siebold, Fauna Jap., Aves, pl. 24: 59 (Japan)

Baker, FBI No. 1203, Vol. 3: 299

LOCAL NAMES. None recorded.

SIZE. Sparrow \pm ; length c. 15 cm (6 in.).

FIELD CHARACTERS. As in 1871, q.v.

STATUS, DISTRIBUTION AND HABITAT. Uncommon winter visitor to Pakistan (Kohat, Bannu, and the plains of the Indus south to Karachi), Nepal (Hodgson specimen in British Mus.; a record from Pokhara, western Nepal, subspecies undetermined — Fleming & Traylor, 1968), Darjeeling (Brooks, SF 8: 485, specimen in Brit. Mus.) and Manipur (Hume, SF 11: 238, no specimen extant). Habitat as in 1871.

MOTACILLIDAE

272

with stress on second note *tyu-see* ... very reminiscent of the song of *Parus major* but slower, less brisk (MD, BBO). Long-drawn, not unpleasant but monotonous whistling *wichee-wichee-wichee* ... repeated in series of 3 to 15, curiously reminiscent of a saw being sharpened with a file (SA). Ventri-loquial and difficult to locate. Apparently also has another song of five notes quite different from the above (Fleming) and more reminiscent of a chat or redstart than a pipit (GD). Song usually given from a boulder or other eminence; sometimes from a tree or during the typical pipit-like song-flight. Song period, mid February to early September, chiefly April to July (Proud).

BREEDING. Season, April to July. Nest, a cup of coarse grass roughly lined with finer grass, well concealed below a tuft of grass or under a stone. Eggs, 3 to 5, very similar to those of *A. similis*, white to pale grey, covered with numerous freckles and small blotches of grey-brown, reddish brown or purple-brown with underlying grey blotches. Average size of 30 eggs 22.6 × 17.5 mm (Baker). Once found brood-parasitized by *Cuculus canorus*.

MUSEUM DIAGNOSIS. The fine shaft-streaks on abdomen and those on breast dividing to form a triangle, the heavy bill and pointed rectrices, identify this species. By wear plumage becomes darker above, due to loss of pale fringes; underparts become dingy white and shaft-lines more conspicuous. A complete moult apparently takes place in September-October.

Young, like adult but dark brown centres on upperparts round-d, broader and edged with pale fulvous. Underparts as adult but whitish with very little fulvous.

Tail from above, \times c. 1

(India, ex Sonnerat, restricted to Malabar by Ripley, 1961, Synopsis: 574)

Baker, FBI No. 1183, Vol. 3: 276

Plate 97, fig. 15

LOCAL NAMES. *Khānjōn* (Bengali—all wagtails); *Kodikāl vālati* (Tamil); *Uz-halla-jitta* (Telugu); *Kāttuvalkūlūkki* (Malayalam); *Gomarita* (Sinhala).

SIZE. Sparrow; length c. 17 cm (6½ in.).

FIELD CHARACTERS. *Above*, olive-brown. A pale supercilium and eye-ring. Wings blackish brown with large yellowish spots or patches forming two prominent bands across the coverts. Upper tail-coverts blackish brown. Tail dark brown with the outer rectrices white. *Below*, white washed with very pale yellow. A blackish brown collar across lower throat and a second interrupted band on breast. Sexes alike.

× c. 1

On the ground looks very like a pipit. The double gorget on breast and whitish double wing-bands are diagnostic.

STATUS, DISTRIBUTION and HABITAT. Mostly a winter visitor, very locally and capriciously distributed. Sri Lanka in forested areas of all zones in moderate numbers; southwestern India (where locally common) from Mahabaleshwar south through Goa, western Karnataka, Kerala and western Tamil Nadu (east to the Madurai district and south to the southernmost part of the Peninsula), from the foothills to c. 2100 m; northern Bengal and in the Khasi and Cachar hills (mostly above c. 1000 m), Tripura, Nagaland and Manipur; Andaman Islands.

18

PIPITS AND WAGTAILS

275

GENERAL HABITS. Usually met with singly in well-wooded country, sometimes in loose pairs or small parties. Forages mostly on the ground, running about quietly on shady forest paths or the mulch-covered floor. Stops short now and again to sway its tail and hind part of body laterally in a very characteristic manner. When disturbed flies up silently, or with the usual *pink* note, into an overhanging branch where it sits wagging its tail slowly up and down and pivoting the hind end from side to side. Descends to the ground to resume foraging immediately its suspicion is allayed. Is much more arboreal than other wagtails. A good deal of its food is procured in trees, the bird running along horizontal boughs and up and down at a steep angle with astonishing celerity. Roosts in company with other wagtails in reed-beds and sugarcane fields.

FOOD. Ants and other insects; spiders. Nestlings are fed on spiders, small grasshoppers, butterflies, beetles, cicadas, snails, molluscs and worms (Neufeldt).

VOICE and CALLS. Call-note, a characteristic finch-like *pink* or *pink-pink* reminiscent of the Crested Bunting. Song, a disyllabic *tri-fee* repeated four or five times, somewhat like the song of the Great Tit (Neufeldt). For details on song see Hoffmann, A., 1932. 'Über den Gesang der Indischen Baumstelze, *Dendronanthus indicus* (Gmelin)'. *Bonner Zool. Beitr.*, 1-2, 3: 11-16.

BREEDING. *Season*, May (Assam) or June (Amurland). *Nest*, a small, neat cup of soft twigs, leaves, fine grass and rootlets compactly matted together with shredded moss and cobweb, lined with hair and moss-roots and draped outside with lichen matching that growing on the supporting branches, thus effectively effacing the structure. It is placed on a horizontal bough (or in a crotch) of a small tree, usually by a stream, some 2 or 3 metres above the ground. *Eggs*, 4 (in Assam), very similar to those of the Chaffinch, grey with a lilac tinge, marked with a few large purple-brown blotches and more numerous secondary ones. Average size of 13 eggs 19.1 × 13.9 mm (above notes by Baker). Building of nest by female alone, accompanied by male. Incubation by female, fed by male at nest; period 13-15 days. Care of young by both parents. For further details of breeding (in Amurland) see Neufeldt, I., 1961, JBNHS 58: 559-79.

MUSEUM DIAGNOSIS. See Field Characters. Hind claw curved and almost as short as on the other toes. A prenuptial moult of body-feathers and central rectrices (HW). Postnuptial moult complete.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	79-83	16-18	23-24	69-77 mm
♀♀	76-82	16-17	c. 22	68-71 mm
20 ♂♀	78-86 (av. 83.1) mm			

(SA, HW, Koelz)

Weight 15 ♂♀ (winter) 14-17 g—SA.

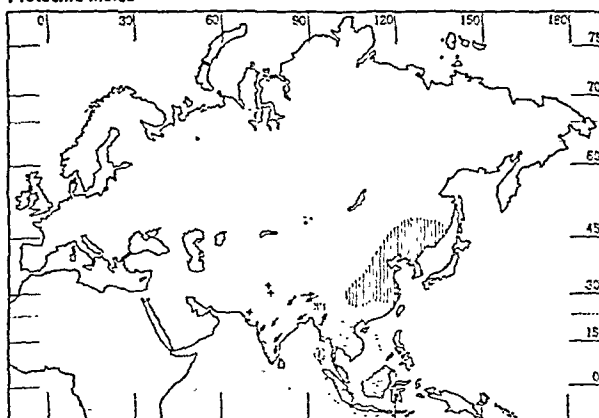

COLOURS OF BARE PARTS. Iris brown. Bill horny brown, paler at base of lower mandible; mouth yellowish pink. Legs, feet and claws horny black. Nestling: gape orange-yellow; tongue yellow with a grey fringe near base.

MOTACILLA FLAVA Linnaeus

274

MOTACILLIDAE

Motacilla indica

Winter

Passage records

Breeding

Stragglers

Breeds in North Cachar (Laisung stream above c. 1500 m. Detailed description of nest and eggs by Baker, *Nidification* 3: 136-8, tallies exactly with that of Neufeldt, 1961, JBNHS 58: 559). For possible breeding in Burma see JBNHS 34: 913. In China the species breeds as far south as southwestern Szechuan and Kweichow (Cheng, 1958).

In winter affects evergreen and deciduous forest. Favourite haunts are well-shaded coffee and cardamom plantations, footpaths through forest and glades or clearings in mixed bamboo jungle. In summer (in Assam) frequents streamsides, glades and tracks in deep evergreen forest.

EXTRALIMITAL. Breeds in eastern Asia from the Ussuri region south through Korea, Manchuria and China to Kweichow and southwestern Szechuan. Winters mostly in southern China, the Indochinese countries, Sumatra, Java and Borneo.

MIGRATION. Arrives in winter quarters in the third week of September, leaves in April (latest 1 May). Has been recorded on passage in Sikkim (both spring and autumn, earliest 9 September), northern Bihar (October), Calcutta, Madhya Pradesh and Godavari valley (undated), Andhra Pradesh (Mananur, Farahabad, Nellore) and eastern Tamil Nadu (Madras, Chingleput) [Sept. and Oct.], and Maharashtra (Bombay) (Feb., Mar., Apr.; once Oct.). Has straggled to Kutch (December-January—JBNHS 65: 225, 67: 333), Simla (Koteghar—April) and Suru Valley (August). A bird ringed in Kerala (c. 9°N., 76°E.) on 25.ii.1963 was recovered two months later, on 25 April at Tiddim in the Chin Hills of Burma (c. 23°N., 93°E.)—2400 km northeast.

1875. Greyheaded Yellow Wagtail, *Motacilla flava thunbergi* Billberg*(Motacilla) Thunbergi* Billberg, 1828, Synops. Faun. Scand. 1 (2): 50 (Lapland)

Baker, FBI No. 1176, Vol. 3: 269

LOCAL NAMES. *Pilkyā* (Hindi); *Metano pilakyo* (Gujarati); *Charattalayan vālkūlūki* (Malayalam); *Fanfouduni* (Maldivian).

SIZE. Sparrow, with a long tail; length c. 17 cm (6½ in.).

FIELD CHARACTERS. *Above*, head, nape and ear-coverts dark slate-grey, sometimes with a trace of a white supercilium. Back olive. Wings brown with two yellowish bars. Tail dark brown with white outer edge. *Below*, bright yellow from chin to under tail-coverts. Winter plumage duller, with the grey on head mixed with olive. Sexes more or less alike.

STATUS, DISTRIBUTION and HABITAT. Widespread and common winter visitor. Pakistan (Peshawar, Jhang district; not reported from Sind and Baluchistan) and India from the plains of the Ganges south through Kutch to Kanyakumari (Cape Comorin), Sri Lanka and the Maldives (sight only), and east through Bengal, Assam and Bangladesh; Andamans and Nicobars. Abundant passage migrant in the Himalayas west of Simla and south to Quetta, and in northwestern India. Rare in Nepal in April and early May (terai and Valley—Proud, 1955). Affects pastures and moist grassy ground especially along riversides and on jheel margins.

EXTRALIMITAL. Breeds from Scandinavia to northwestern Siberia. Winters mostly in Africa south of the Sahara.

MIGRATION. A. E. Jones's observations at Simla suggest that the migrating hordes of Yellow Wagtails which are such a feature in Punjab fly directly over the Himalayan ranges by night (HW). First migrants arrive by the end of August (Quetta); autumn passage mostly in September and October, spring passage from end of March to early May (latest 13 May—N.W.F.P.). Arrival in Sri Lanka end of September, latest seen early May.

Four birds ringed in Kerala in December and January, 1962-4, were recovered 4 to 16 months later in the Kazakh and Kirghiz Republics of the U.S.S.R., at map distances of between 3700 and 4200 km north. For details see JBNHS 60: 461, 736; 61: 451, 693.

PIPITS AND WAGTAILS

277

GENERAL HABITS, FOOD and VOICE. As in 1876. Among the stomach contents in Bihar were found caterpillars and small beetles, chiefly Hydrophilidae (Water Scavengers); also spiders (Mason & Lefroy, 1912).

BREEDING. Extralimital.

MUSEUM DIAGNOSIS. See Field Characters and Key to the Subspecies.

Immature (first-year) birds cannot be identified with absolute certainty.

For details of plumages see Ticehurst, 1922, JBNHS 28: 1087. Distinguished from *M. caspia* by the hind claw which is less curved and longer than hind toe.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	81-85	15-16	23-24	71-77 mm
♀♀	70-80		22-25	70-71 mm
				(HW, SA)

Weight 13 ♂♀ (winter) 14-17 g—SA. 1 ♂ 17.3; 1 ♀ 16.8; 1 ♂ 13.6 g (thumbergi? — Bangladesh) — RAP.

COLOURS OF BARE PARTS. As in 1876.

1875a. Short-tailed Greyheaded Yellow Wagtail. *Motacilla flava similima* Hartert

Motacilla flava similima Hartert, 1905, Vög. pal. Fauna: 289 (Kamchatka)
Baker, FBI No. 1176a, Vol. 8: 660

LOCAL NAMES. As in 1875.

SIZE. Sparrow, with a long tail; length c. 17 cm (6½ in.).

FIELD CHARACTERS. Spring plumage as in *thumbergi* but white supercilium well marked (as in *beema*) and ear-coverts very dark. Breast usually marked with blackish spots. Winter plumage not differentiable.

STATUS, DISTRIBUTION and HABITAT. Common winter visitor to Kerala (Sálim Ali, JBNHS 38: 762 and *Birds of Kerala*: 400; Primrose, JBNHS 40: 502; cf. also JBNHS 60: 411-12), Sri Lanka (Phillips, SZ 28, part 2: 189) and the Andaman Islands (Vaurie, 1959). Recorded on passage from Bharatpur, Rajasthan, between 17 March and 9 April (JBNHS 60: 413). Habitat as in 1875.

Extralimital. Breeds in Kamchatka. Winters in the Indochinese countries, Malaya, Indonesia and Philippines.

GENERAL HABITS, FOOD and VOICE. As in 1876.

MUSEUM DIAGNOSIS. See Field Characters and Key to the Subspecies. 'Indistinguishable in winter plumage from *beema* except [doubtfully] by its longer and straighter (less curved) hind claw' (H. Johansen, pers. comm.).

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
2 ♂♂	78, 83	14, 16	24 (1)	69 mm
2 ♀♀	78, 78		23 (1)	66, 67 mm
				(HW, Phillips)

COLOURS OF BARE PARTS. Iris brown. Bill horny brown, paler (yellowish) on commissure and at base of lower mandible; mouth pale yellowish pink. Legs, feet and claws blackish brown; soles yellow.

PIPITS AND WAGTAILS

279

characteristic of the family, a few rapid flaps followed by a shallow dip with wings closed.

FOOD. Insects. Identified items include flies (muscid), pentatomid bugs (*Cydnius nigrilus*), tenebrionid and elatrid beetles (*Mesomorpha villiger*, *Heteroderes* sp.) and weevils (*Myloceus* sp.) — Mason & Lefroy, 1912.

VOICE and CALLS. Call-note uttered chiefly when taking off and in flight, a high-pitched wizz or weesp (or a double weesp-weep), characteristic of the species. Song undescribed.

BREEDING. Season, chiefly June. Nest, a cup of grass and rootlets lined with wool and placed among the roots of grass tussocks. Eggs, about 4, white more or less tinged with grey, densely stippled with pale grey or pale reddish brown. Average size of 40 eggs 19.5 × 14.8 mm (Baker).

MUSEUM DIAGNOSIS. See Key to the Subspecies. Supercilium of male often includes a few yellow feathers, occasionally numerous enough to make the supercilium appear yellow. Distinguished from other races by pale grey head, prominent supercilium, white chin and malar streak, and pale grey-and-white ear-coverts. In winter plumage difficult to distinguish from *similima* and *thumbergi* but darker ear-coverts of latter usually suggestive. For details of plumages see Ticehurst, JBNHS 28: 1087.

Spring moult of body-feathers, lesser, median and some greater coverts, central pair of rectrices and some secondary remiges from January to April. A complete moult from July to September.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	76-84	15-16	22-25	67-73 mm
♀♀	77-88		22-23	67-71 mm
				(HW, CBT)

Wing 20 ♂♀ 76-85 (av. 79.9) mm — SA.

Weight 12 ♂♀ (winter) 14-21 (av. 17.3) g — SA. 8 ♂♂ 15.3-16.8 (av. 16.2); 2 ♀♀ 13.4, 14.5 g — Dementiev.

COLOURS OF BARE PARTS. Iris brown. Bill horny brown, paler at base of lower mandible; gape dull lemon-yellow; mouth yellowish pink. Legs, feet and claws horny brown.

1877. Yellowbacked Wagtail. *Motacilla flava lutea* (Gmelin)

Parus luteus Gmelin, 1774, Reise d. Russ. 3: 101 (Astrakhan)
Not in Baker, FBI

LOCAL NAMES. None recorded.

SIZE. Sparrow, with a long tail; length c. 17 cm (6½ in.).

FIELD CHARACTERS. As in 1876 but most of head yellow without distinct supercilium.

STATUS, DISTRIBUTION and HABITAT. Winter visitor to India south to Sri Lanka (Vaurie, 1965). Habitat as in 1875.

Extralimital. Breeds between the lower Volga and the Ittysh rivers. Winters chiefly in eastern Africa from the Equator south to Transvaal.

MIGRATION Presumably as in 1875.

GENERAL HABITS, FOOD and VOICE. As in 1876.

278

MOTACILLIDAE

1876. Blueheaded Yellow Wagtail. *Motacilla flava beema* (Sykes)

Budytes beema Sykes, 1832, Proc. Zool. Soc. London: 90 (Dukhun)
Baker, FBI No. 1175, Vol. 3: 267

LOCAL NAMES. As in 1875.

SIZE. Sparrow, with a long tail; length c. 17 cm (6½ in.).

FIELD CHARACTERS. Above, head pale bluish grey with a prominent white supercilium and a white malar streak. Rest of plumage as in 1875.

Sexes more or less alike, but upperparts of female brown with a strong olive-green wash except on head. Underparts paler yellow than in male. Winter plumage similar but duller.

Foot, showing well curved hind claw, x c. 1

STATUS, DISTRIBUTION and HABITAT. Abundant and widespread, winter visitor. Pakistan from Punjab to Sind, Nepal Valley, and India from the plains of the Ganges south to Andhra Pradesh, Kerala (in the hills up to c. 1500 m), and east through Bangladesh and Assam; also Nicobar and Maldiva islands. Breeds in Ladakh and possibly northern Kashmir between c. 3600 and 4500 m (cf. Baker, *Identification* 3: 134; Meinerzhagen, *Ibis* 1927: 404). Abundant passage migrant in the western Himalayas, N.W.F.P. and northern Baluchistan (spring). Habitat as in 1875.

Extralimital. Breeds in the central Palaearctic from the Volga to Baikal. Winters also in eastern Africa south to Kenya and Uganda.

MIGRATION. Periods as in 1875. A bird ringed on 2 February 1963 in Kerala was recovered on 10 May of the same year near Kabul, 2800 km north, presumably on passage.

GENERAL HABITS. Usually seen in small loose flocks often intermixed with other subspecies; occasionally, during the migration season, in more or less compact aggregations of several birds. They are usually seen on moist pastures or urban areas, commonly in attendance on grazing cattle. Trips lightly or in short runs in and out among the animals' feet, the birds sometimes leaping over one another or flying ahead in their eagerness to head off the insects disturbed in the grass. Stops intermittently and wags its tail up and down in the typical manner. In some localities, e.g. around the coastal backwaters in Kerala, the squelchy newly-cut paddyfields virtually ripple with hundreds upon hundreds of Yellow Wagtails (mainly the subspecies *beema*, *thumbergi* and *similima*), the birds running about and feeding on the wet mud, flying up in loose rambling flocks now and again and re-settling close to the reapers at work. Roosts at night along with other wagtails, often in phenomenal numbers, in reed-beds and sugarcane fields, sometimes commuting to and from distances up to 30 km or more. The returning parties of birds coalesce to mill around above the roost site at sunset like a dense swarm of bees, before dropping into the reeds like flurries of falling leaves. For description of one such typical roost see Sálim Ali, JBNHS 59: 294-6. Flight undulating, as

280

MOTACILLIDAE

BREEDING. Extralimital.

MUSEUM DIAGNOSIS. See Key to the Subspecies.

1878. Turkestan Blackheaded Wagtail. *Motacilla flava melanogrisea* (Homeyer)

Budytes melanogriseus Homeyer, 1878, Jour. f. Orn. 26: 128 (India)
Baker, FBI No. 1180, Vol. 3: 272

Plate 97, fig. 17

LOCAL NAME. *Pilā māmols* (Urdu).

SIZE. Sparrow, with a long tail; length c. 17 cm (6½ in.).

FIELD CHARACTERS. As in 1875 but head black, no supercilium. Sexes more or less alike but upperparts of female brownish grey tinged with olive-green, head darker. Underparts yellowish white, often with dark spots in the pectoral region. In winter plumage not distinguishable from other subspecies.

STATUS, DISTRIBUTION and HABITAT. Common winter visitor to Pakistan and India from the foothills east to the western Nepal terai and Varanasi, and south to Sind, Kerala (JBNHS 60: 412) and northern Andhra Pradesh (JBNHS 36: 909); vagrant to Sri Lanka. Passage migrant in Baluchistan (Chagai, Quetta, Makran coast) and western Himalayas. Habitat as in 1875.

Extralimital. Breeds in Russian Turkestan.

MIGRATION. As in 1875. Earliest date (Kutch) 30 Aug. A bird observed at late as 22 June near Sukkur, Sind (JBNHS 66: 26).

MUSEUM DIAGNOSIS. See Key to the Subspecies. For details of plumages see Ticehurst, JBNHS 28: 1086.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♀	75-85	16-18	23-24	64-76 mm
				(CBT, SA)

Weight 19 ♂♀ (winter) 14-17 (av. 15.7) g — SA.

COLOURS OF BARE PARTS. Iris brown. Bill horny brown, paler at base of lower mandible; gape dull lemon-yellow; mouth yellowish pink. Legs, feet and claws dark slate.

1879. Whiteheaded Yellow Wagtail. *Motacilla flava leucocephala* (Przevalski)

Budytes leucocephala Przevalski, 1887, Zap. Imp. Acad. St. Pétersb. 53: 83 (Altai)
Baker, FBI No. 1178, Vol. 3: 270

LOCAL NAME. *Pilyā* (Hindi).

SIZE. Sparrow, with a long tail; length c. 17 cm (6½ in.).

FIELD CHARACTERS. As in 1876, but easily distinguishable by the almost pure white crown and ear-coverts.

PIPITS AND WAGTAILS

281

STATUS, DISTRIBUTION and HABITAT. Scarce passage migrant (possibly winter visitor, but see Migration below). Recorded mostly from Punjab (Pakistan) [cf. *Ibis* 1916: 75; JBNHS 24: 189 and 40: 561; *Ibis* 1940: 335-7 and 732; JBNHS 59: 963]; also observed near Delhi (JBNHS 62: 304-5). Winter quarters, if within our limits, unknown. Habitat as in Greyheaded Yellow Wagtail (1875).

Extralimital. Breeds in northwestern Mongolia, perhaps northern Dzungaria and occasionally in the Kirghiz steppes (Vaurie). Winter quarters unknown.

MIGRATION. All published records fall between 11 April and 10 May and all but one in the Rawalpindi district. Birds were observed in flocks up to 20 individuals, or singly among other subspecies.

GENERAL HABITS, FOOD and VOICE. As in 1876, q.v.

BREEDING. Extralimital.

MUSEUM DIAGNOSIS. Whole head to the nape white with a faint grey shadow on the ear-coverts and posterior part of the crown.

MEASUREMENTS and COLOURS of BARE PARTS unrecorded.

1880. Greenheaded Yellow Wagtail. *Motacilla flava taiwana* (Swinhoe)

Budytes taiwana Swinhoe, 1863, Proc. Zool. Soc. London: 274, 334 (Formosa)

Baker, FBI No. 1177, Vol. 3: 270

Plate 97, fig. 16

LOCAL NAME. *Pilkyā* (Hindi).

SIZE. Sparrow, with a long tail; length c. 17 cm (6½ in.).

FIELD CHARACTERS. Above, olive-green. A broad yellow supercilium. Lores and ear-coverts blackish. Below, deep yellow. Sexes more or less alike.

STATUS, DISTRIBUTION and HABITAT. Winter vagrant. Two records: Howrah, Bengal; western Bhutan, 4850 m Sept. (SDR coll.).

Extralimital. Breeds in southeastern Siberia and Sakhalin Islands. Winters in Taiwan, southern China, the Indochinese countries, Malaysia and Indonesia east to Celebes (Sulawesi).

GENERAL HABITS, FOOD and VOICE. As in 1876.

MUSEUM DIAGNOSIS. See Field Characters. Flanks, and often breast, washed with dull greenish.

MEASUREMENTS

Wing ♂♂ 78-84; ♀♀ 77-82. Tail 65-74 mm (Dementiev, Baker)

Weight 1 ♂ 19 g (SDR).

COLOURS of BARE PARTS. As in 1876.

PIPITS AND WAGTAILS

283

GENERAL HABITS, FOOD and VOICE. As in 1883.

BREEDING. Extralimital.

MUSEUM DIAGNOSIS. Adult male. Back, including rump and upper tail-coverts grey. Generally a black hind-collar separating yellow head from upper back. For details of plumages see Ticehurst, JBNHS 28: 1082-4.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	81-88	15-17	23-27	71-84 mm
♀♀	83-84			79-80 mm

Hind claw 10-12 mm; median toe and claw 20-22 mm

(GBT, BB, Rand & Fleming)

Weight 1 ♂ (Nov.) 18.2; 1 ♀ (Nov.) 17.9 g (BB).

COLOURS of BARE PARTS. Iris very dark brown. Bill, legs and feet black.

1882. Western Yellowheaded Wagtail. *Motacilla citreola werae* (Buturlin)

Budytes citreola werae Buturlin, 1907, Orn. Monatsb. 15: 197

(Sura Valley, Simbink, southeastern Russia)

Baker, FBI No. 1181 (part), Vol. 3: 273

LOCAL NAMES. As in 1881.

SIZE. Sparrow, with a long tail; length c. 17 cm (6½ in.).

FIELD CHARACTERS. As in 1883 but always grey-backed, rarely with black hind-collar (cf. 1881). Subspecies not differentiable in the field.

STATUS, DISTRIBUTION and HABITAT. Winter visitor, locally common. Pakistan in Kohat, Bannu, Punjab and probably Sind, and India from the Himalayan foothills south at least to N. Karnataka (Londa, Koelz) and Hyderabad (SA) and east through Assam and Bangladesh. Habitat as in 1883.

Extralimital. Breeds in southwestern Siberia from the Ob river to the Volga.

MIGRATION. Arrives in winter quarters in September, leaves in March-April (extreme dates 5 September and 17 May). Common on passage in northern Baluchistan (February to early May, not observed in autumn); also in the western Himalayas (Kashmir, Gilgit). Two ring recoveries to date give an indication of the pattern of local movements within the country. A bird ringed in Rajasthan (Bharatpur, 27°13'N., 77°32'E.) on 4 October 1962 on autumn passage was recaptured in Kerala (9°20'N., 76°38'E.) on 13 January 1964. Another example (ssp.?) ringed near Calcutta (c. 22°N., 89°E.) on 25 May 1963 on late spring passage was recaptured in Kerala (same coordinates) on 29 November 1963, presumably on return from its breeding grounds.

GENERAL HABITS, FOOD and VOICE. As in 1883.

BREEDING. Extralimital.

MUSEUM DIAGNOSIS. Similar to nominate *citreola* [1881] but paler. Adult males grey above, yellow parts paler and not, or only slightly, tinged with grey on flanks. Averages smaller.

282

MOTACILLIDAE

1881. Northern Yellowheaded Wagtail. *Motacilla citreola citreola* Pallas

Motacilla citreola Pallas, 1776, Reise Russ. Reichs 3: 696 (Siberia)

Baker, FBI No. 1181 (part), Vol. 3: 273

Plate 97, fig. 20

LOCAL NAMES. *Pilkyā*, *Pāni-kā-pilkyā* (Hindi); *On munda* (Chota Nagpur); *Tooni* (Assam).

SIZE. Sparrow, with a long tail; length c. 17 cm (6½ in.).

FIELD CHARACTERS. As in 1883 but back grey instead of black; plumage phases variable and confusing, and subspecific identification especially in winter often unreliable.

STATUS, DISTRIBUTION and HABITAT. Fairly common winter visitor. Pakistan [Kohat and the Punjab foothills south through Sind, and very locally in Baluchistan (Hab Valley)], and India from the Himalayan foothills including the Nepal terai east through Assam and Bangladesh, south

Motacilla citreola

2 *werae* (1882) 3 *calcarata* (1883)

at least to northern Karnataka and Point Calimere, Tamil Nadu (JBNHS 60: 412); sight records from Sri Lanka (ssp.? cf. Phillips, SZ 28, part 2: 89). Habitat as in 1883.

Extralimital. Breeds in Siberia from the Pechora river east to the Khatanga river and south to Transbaikalia. Winters east through the Indochinese countries and southern China.

MIGRATION. Arrives in winter quarters in September (earliest 5 Sept.), leaves in April and early May (latest 15 May). A passage migrant in northern Baluchistan and western Himalayas.

284

MOTACILLIDAE

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	75-86	15-17	23-26	69-75 mm
♀♀	72-79			— mm

(HW, NBK, Koelz)

Weight 2 ♂♂ 16, 19 g (Dementiev).

COLOURS of BARE PARTS. Iris brown. Bill horny brown, paler at base of lower mandible; gape dull lemon-yellow; mouth yellowish pink. Legs, feet and claws horny brown.

1883. Blackbacked Yellowheaded Wagtail. *Motacilla citreola calcarata*

Hodgson

Motacilla (Budytes) Calcarata Hodgson, 1836, Asiatic Res. 19: 190 (Nepal)

Baker, FBI No. 1182, Vol. 3: 274

LOCAL NAMES. *Ledor dabbai*, *Peench kani* (Kashmir); *Pilkyā*, *Pāni-kā-pilkyā* (Hindi); *Pān pillākh* (Bihar mirshikars); *On munda* (Chota Nagpur); *Tooni* (Assam).

SIZE. Sparrow, with a long tail; length c. 17 cm (6½ in.).

FIELD CHARACTERS. Male. Above, head rich lemon-yellow. Back and rump jet black. Wings dark brown with white edgings to coverts and tertials. Tail dark brown with white outer edges. Below, rich lemon-yellow, sides of breast black. In winter the back is dark grey more or less mixed with black.

Female variable: either similar to male or with yellow of head paler; many individuals with dark greyish crown and mantle, yellow forehead, supercilium and ear-coverts, the last more or less streaked with grey.

First-year birds of both sexes have whitish underparts. Males may be found breeding in this plumage.

STATUS, DISTRIBUTION and HABITAT. Common summer (breeding) visitor to Pakistan, from northern Baluchistan through N.W.F.P. to Chitral, east through Kashmir, Gilgit, Balistan, Ladakh, Lahul, Spiti and southern Tibet (Mt Everest, JBNHS 32: 325) north of the main range. Breeds mostly between 3000 m and 4600 m; in the Kagan Valley down to 2600 m, in Chitral to 1800 m and in Kashmir to 1500 m. Affects sedges and grassy margins of lakes, streams, water-meadows, bogs and irrigated ploughed land. Winters in Pakistan (Indus plains south to Sind) and northern India (a few in the Nepal Valley) south to Kutch, Madhya Pradesh, Bengal and east through Bangladesh and Assam. In winter frequents marshes, squelchy grassy margins of tanks and jheels, and irrigated rice-fields, etc.

Extralimital. Breeding range extends west to eastern Iran, north on the Tibetan plateau to southern Tsinghai and Inner Mongolia, and east to Szechuan. Winters from southern Afghanistan to Burma.

MIGRATION. Arrives on breeding ground in April, remains until September. Autumn passage in September and October, in Punjab noted as early as the beginning of August. Spring passage March to early May. Extreme dates in winter quarters 5 September and 9 May.

GENERAL HABITS. Typical of the genus, but is essentially a marsh-inhabiting or water wagtail. Gregarious in winter. Keeps in scattered pairs or parties, sometimes large flocks, usually in association with Yellow and

PIPITS AND WAGTAILS

285

other wagtails, seldom away from damp or marshy ground. Often seen on tanks and jheels tripping lightly over floating lotus leaves and partly submerged vegetation in search of insect food. Sometimes springs up in the air and launches fluttering sallies in pursuit of escaping midges etc. Runs about briskly with sprightly mincing steps, stopping now and again and wagging the tail up and down. Undulating flight and other habits as of other wagtails.

FOOD. Insects and larvae; tiny molluscs.

VOICE AND CALLS. Call-note *chiz-zit*. Song undescribed.

BREEDING. Season, May to August. Nest, a compact cup of dry grass, rootlets and moss lined with wool or hair, placed on the ground in tufts of grass, at the foot of a bush or occasionally under a stone. Eggs, normally 4, sometimes 3 or 5, greenish grey heavily spotted and speckled with grey or olive-grey. Average size of 80 eggs (Ladakh) 20.9 × 15.1 mm, of 60 eggs (Kashmir) 20.1 × 14.5 mm (BBO), of 80 eggs 20.7 × 15.6 mm (Baker). Sometimes brood-parasitized by *Cuculus canorus*. Building of nest, incubation and care of young by both sexes. Incubation period undetermined.

MUSEUM DIAGNOSIS. Distinguished from other subspecies by black back; underparts darker and richer yellow. Tarsus longer than in the other two races; also longer than in the Yellow wagtails. For details of plumages see Ticehurst, JBNHS 28: 1082-5.

Young: Above, rich brown. Supercilium buffish surmounted by a broad, nearly black line. Below, buffish brown, whitish on vent and throat, with a black moustachial line running down each side to the spotted pectoral band.

A spring moult of body-feathers, tertials, median coverts, part of lesser or greater coverts and central rectrices in February and early March. Postnuptial moult complete. Adult plumage not acquired in the first spring; first-summer birds distinguished from adults by less bright yellow, a yellowish olive-brown crown, and darker less yellow ear-coverts.

MEASUREMENTS

PIPITS AND WAGTAILS

287

Extralimital. Breeds in mountainous regions of the Palaearctic from Kamchatka, Japan, Kansu and probably Szechuan (specimens in U.S. Nat. Mus. collected in July) west to the British Isles and Morocco. Other subspecies in Atlantic islands. Winters in the Mediterranean region, Africa, south to Congo and Kenya, the Middle East, Turkistan, southern China, Taiwan, the Indochinese countries, Indonesia including West Irian, and the Philippines.

MIGRATION. First winter visitors arrive in the Peninsula about the end of August (earliest 21 August, Kerala, 22 August, Berar). Departure mostly in April, a few birds remaining until early May (latest and rather exceptional, 22 May, Kerala). Passage noted in northern Baluchistan (Chagai) and throughout the Himalayas including Sikkim, Bhutan and Arunachal Pradesh. Several birds observed at c. 4400 m in Chamba in August. For a summary of observational data on migration up to 1923, see Whistler, H., JBNHS 29: 287. For records of attachment to specific winter quarters and clockwork punctuality of return to the same in autumn (September) — in one case for at least five consecutive years after ringing — see JBNHS 47: 160; 48: 185.

GENERAL HABITS. Keeps singly at all seasons, sometimes in separated pairs, but during winter numbers may gather at sunset to roost in trees, dense patches of tamarisk or reeds, or sugarcane fields, occasionally (rare) in company with other wagtails. A pure communal roost may hold up to 40 or 50 individuals but never such large congregations as, e.g. of Yellow wagtails. Is fond of running about and feeding at streamlets and trickles across forest paths or alongside hill roads. The bird often keeps flying ahead at disturbance from an oncoming car and resettling a hundred metres further to be supplanted again almost immediately, and again and again. At the end of its beat it veers off into the forest and circles back to the starting-point. Sometimes captures midges in the air by springing up from a rock beside a stream, turning and twisting in the pursuit with remarkable agility and returning to the base. The long tail is vehemently wagged up and down as the bird pauses between short zigzag runs or upon alighting after a flight. Flight undulating, typical of the family.

Display. In the breeding season the male constantly launches himself a few metres up in the air and descends at a tangent on fluttering wings some distance away uttering a pretty little song — a rapid *chi-chi-chi-chi-chi*.

FOOD. Chiefly insects, including butterflies occasionally; tiny molluscs.

VOICE AND CALLS. Call-note a sharp *chi-cheep*, *chi-cheep* uttered in flight. Song a thin twitter rendered as *piti*, *pi-iti*, *pitiiti* (Bates & Lowther); see also Display (above).

BREEDING. Season, end April to end July. Nest, a cup of dry grass and weeds lined with hair and wool, placed in banks, stone walls or among boulders, occasionally in a clump of weeds. Eggs, 4 or 5, rarely 6, whitish profusely marked with pale grey or pale reddish brown stipples, so finely and evenly distributed over the whole surface that the egg appears uniform and 14.1 mm (BBO). Building of nest, incubation and care of young by both sexes. Incubation period unrecorded.

286

MOTACILLIDAE

SIZE. Sparrow, with a long tail; length c. 17 cm (7 in.).

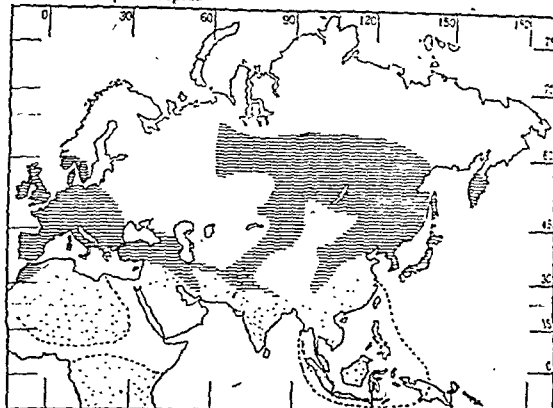

FIELD CHARACTERS. Male (summer). Above, head and back grey. A white supercilium. Upper tail-coverts greenish yellow. Wings dark brown with whitish margins to tertials showing as a prominent V on back. Tail blackish brown with white outer edges. Below, throat black with a white malar streak. Rest of underparts bright yellow.

Male in winter has a buffish throat, paler yellowish underparts (brighter yellow on vent) and V on back indistinct.

Female has a buff throat (mottled with black in summer) and paler underparts. Sexes indistinguishable in winter.

STATUS, DISTRIBUTION AND HABITAT. Common summer (breeding) visitor to the ranges of Pakistan from northern Baluchistan to Chitral, thence east through Gilgit, Baltistan, Ladakh and Kashmir to central Nepal. Breeds between 2100 and 2900 m (Quetta), 1800-2400 m (Safed Koh), 1800-3900 m (western Himalayas), locally down to 1200 m (Kulu) and between 2100 and 4300 m (Nepal). Winters in the foothills, sparsely up to c. 1500 m, in Nepal,

Motacilla caspica caspica

Breeding

Winter

M. c. caspica (1884)

Sikkim and Bhutan to 2000 m, and south throughout the Indian Peninsula and Sri Lanka, Pakistan (Gilgit, Kashmir, N.W.F.P. foothills, Indus Plains and Makran coast), Bangladesh, Assam, Arunachal foothills, Nagaland and Manipur; also the Maldives, Andaman and Nicobar islands. Common in winter in the plains as well as at all elevations in the peninsular hills. Winter population largely augmented by palaearctic migrants. In summer affects rapid mountain streams especially those with rocky banks and boulders. In winter also placid rocky streams and trickles in the plains and foothills. Rock pools in dry stony river beds.

MOTACILLIDAE

288

MUSEUM DIAGNOSIS. See Field Characters and Key to the Species. Distinguished from *M. flava* (all races) by the hind claw which is much curved and shorter than hind toe.

Young. Above, as winter adult but tinged brown. Rump and upper tail-coverts duller. Median and greater coverts with pale tips. Below, dull buffy white, whitish on belly. Under tail-coverts pale buffy yellow. Postjuvinal moult of body-feathers, lesser, median and greater coverts, tertials and central rectrices.

A spring moult of body-feathers, median, inner greater coverts, tertials and tail.

MEASUREMENTS

SIZE. Bulbul; length c. 18 cm (7 in.).

FIELD CHARACTERS. An unmistakable slim black, white and grey bird with a long tail constantly wagged up and down.

PIPITS AND WAGTAILS

289

Head, foot, and wing, $\times c. 1$

Male adult, winter. Above, forehead, round eyes and sides of head white. A large black patch on hind crown and nape. Back and rump ashy. Wings brown, coverts and tertials broadly margined with white. Tail blackish brown with white outer rectrices. Below, white with a large crescent-shaped black patch on breast. Sides of breast and flanks ashy. Sexes practically alike.

In spring and summer the chin, throat and breast are black.

Distinguishable at all seasons from the confusingly similar *personata* (1886) by white ear-coverts (v. black).

STATUS, DISTRIBUTION AND HABITAT. Widespread and common winter visitor. Pakistan in the plains and foothills (in Punjab up to c. 1000 m, in Baluchistan 1800 m), Nepal (up to 1500 m) and the Himalayan foothills south through the Indian Peninsula to Karnataka and Andhra Pradesh, rare in Kerala and Tamil Nadu (in the hills up to c. 1500 m), occasional in Sri Lanka; also Bangladesh (all parts), Assam, Nagaland (?) and Manipur. Affects open country in the vicinity of rivers, streams, tanks, flooded lawns, maidans, paddy- and wheat-fields, compounds and suburbs.

Extralimital. Breeds in western Siberia from the Yenisey to the Ural Mts. The species ranges over the whole of Eurasia from the Chukchi Peninsula, Japan and China west to Morocco, the British Isles and Iceland, and winters from the southern parts of the breeding range south to the Congo, Kenya, Arabia, the Indochinese countries and the Philippines.

MIGRATION. Passage observed in northern Baluchistan, N.W.F.P. and from Gilgit and Kashmir east to Sikkim. Autumn passage, end of September and October (earliest 13 Sept.); northward movements noted from the middle of February until the end of April (last date 5 May in Kangra). Waves of passage migrants observed both in autumn and spring on the coast of Maharashtra (Bombay). Two birds banded in Kutch (c. 22°N,

COLOURS OF BARE PARTS. Iris brown. Bill brownish black; mouth yellow and greyish pink, or greyish pink. Legs, feet and claws brownish black.

1886. Masked Wagtail. *Motacilla alba personata* Gould

Motacilla personata Gould, 1861, Bds. Asia 4, pl. 63 (Bengal)

Baker, FBI No. 1168, Vol. 3: 259

Plate 97, fig. 13 (left) (head)

LOCAL NAMES. *Buyachin* (Hunza); elsewhere as in 1885.

SIZE. Bulbul; length c. 18 cm (7 in.).

FIELD CHARACTERS. As in 1885 but ear-coverts and sides of neck black; no interruption between black of throat and black of nape. White on head limited to forehead, a small area around the eye and a short supercilium. White on wing more extensive. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Fairly common summer (breeding) visitor and partial migrant in northern Baluchistan, N.W.F.P. (Kurram and Kagan valleys, Chitral), Hunza, Gilgit, Baltistan and sporadically eastwards in Ladakh (Shushal—Osmaston, *Ibis* 1925: 700), Kashmir (Liddar Valley, JBNHS 19: 992), Kulu (perhaps exceptional at low altitude, cf. Whistler, JBNHS 22: 282 and 31: 473). Recorded at Manangbhot, central Nepal in July at c. 3500 m (Lowndes, JBNHS 53: 35). Hybridizes or intergrades with *alboides* in Nuristan (Paludan), Hunza, Gilgit, Astor, Sind Valley and Pir Panjal. Breeds from c. 800 m upwards in the Kurram Valley, between 900 and 2700 m in the Kagan Valley, 1500-3600 m in Chitral, at c. 2700 m in the Liddar Valley, 4300 m in Ladakh, and 1350 m in Kulu. In summer affects streambanks in open country. Winters in most parts of Pakistan, India and Bangladesh (everywhere less common than *dukhunensis*; scarce in extreme south), in the foothills up to c. 1500 m (Nepal and western Himalayas). In winter frequents ploughland, watercourses, lawns, etc.

Extralimital. Breeds also in Afghanistan and Turkestan.

MIGRATION. Much as in 1885. First autumn migrants arrive in the foothills at the end of August. On passage noted as high as 5500 m.

GENERAL HABITS, FOOD AND VOICE. As in 1885.

BREEDING. As in 1887. Breeding side by side with *M. madraspatensis* described, Whistler, JBNHS 29: 282. Average size of 45 eggs 20.1 \times 15.2 mm (Baker).

MUSEUM DIAGNOSIS. Grey back in conjunction with black ear-coverts and sides of neck connecting black of nape to that of throat easily identify this subspecies in summer plumage. In winter similar to *alboides* but mantle paler.

Young like that of *dukhunensis* but cheeks and ear-coverts dark grey; not distinguishable from young of *alboides*.

290

MOTACILLIDAE

69°E.) on 16 and 17 March 1961 were recovered in the U.S.S.R., one at Kirov (c. 58°N., 49°E.) in June/July 1961, the other near Volgograd (c. 49°N., 49°E.) on 11.vii.1961, at distances of c. 4200 and 3600 km north-west.¹

GENERAL HABITS. Keeps singly, in pairs or in small loose flocks. Large numbers gather in the evenings to roost in reed-beds, sugarcane, tamarisks or leafy trees. Feeds almost exclusively on the ground, walking or running with quick mincing steps, darting here and there for tiny insects, often fluttering into the air for flying prey. May often be seen perching on rooftops, and is commonly active on urban playing fields regardless of cricket and other games in progress. Tail vigorously wagged up and down when alighting and between short pauses when feeding. Flight very undulating, as of the family. Much competition for feeding territory noticeable at migration stop-overs and on first arrival in autumn. Two rivals, some 30 cm apart, will run parallel to one another for a metre or so, both in the same direction or passing one another in opposite directions, turning about at the end and repeating the tactic. From time to time one will spring up vertically, obviously with intention to attack. Its adversary will leap up in the same way as if to ward off the attack. Now and again one of the combatants will move away from the invisible barrier as if tired of the game, but will presently change its mind and return to the sparring. This patrolling may be continued for many minutes at a time, seldom with any actual clinch, and the whole manoeuvre may be renewed periodically.

FOOD. Chiefly insects. Specifically identified among stomach contents are ants, *Phidole malinsi*, *Camponotus compressus* (Formicidae); *Rhyssalus germanus* (Aphodiinae); water scavengers; *Hydrophilus* sp. (Hydrophilidae); beetles, *Scleron orientale* (Coleoptera), bugs, *Chrysocoris alba* (Pentatomidae); small molluscs (*Hydrobia* sp.); and oat grains (Mason & Lefroy, 1912); also a variety of other insects and larvae—bibionid flies, small caterpillars, weevils and other small beetles including Carabidae.

VOICE AND CALLS. Ordinary call-note a sharp *chi-cheep* usually uttered in flight.

BREEDING. Extralimital.

MUSEUM DIAGNOSIS. Distinguished from *personata* (1886) by white ear-coverts in all plumages; for other subspecies see Key.

Prenuptial moult from January to March, involving body-feathers, tertials, lesser, median and all except two or three greater coverts, and central rectrices.

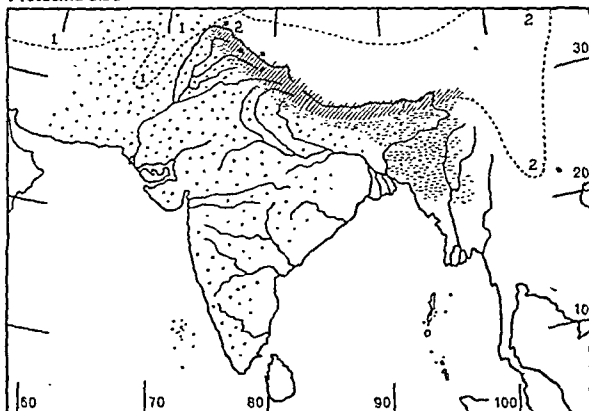

Young. Upperparts and lesser coverts grey tinged with brown, rump darker slate, upper tail-coverts blackish. Broad supercilium, cheeks and ear-coverts dull white. Median coverts tipped with whitish, greater coverts brown with whitish outer edges and tips. Postjuvénal moult of body, lesser, median and inner half of greater coverts.

First-winter male like adult but crown more or less mixed with grey. White of forehead not so pure or so extensive. Ear-coverts often tipped with grey. First-winter female like male but no black in crown. Forehead white sullied with grey to almost no white at all.

¹ These probably belonged to nominate *alba*, hitherto considered extralimital, being so far westward of the known range of *dukhunensis* (see above). In immature and winter plumages, as mostly seen in India, the two subspecies cannot be separated.

1887. Hodgson's Pied Wagtail. *Motacilla alba alboides* Hodgson

(*Motacilla*) *Alboides* Hodgson, 1836, Asiat. Res. 19: 191 (Nepal)

Motacilla alba albula Koelz, 1954, Contrib. Inst. Regional Exploration, No. 1: 20 (Bara Pani, Khasia Hills)

Baker, FBI No. 1171, Vol. 3: 262

LOCAL NAMES. *Tengchenflew* (Lepcha); elsewhere as in 1885.

SIZE. Bulbul; length c. 18 cm (7 in.).

FIELD CHARACTERS. As in 1886 but back and rump black (v. grey).

STATUS, DISTRIBUTION AND HABITAT. Common summer (breeding) visitor, vertical and short-range migrant. Breeds from Gilgit (rare) eastwards commonly in Balistan, 2500 m, Ladakh from the lowest levels up to 4500 m, Kashmir above c. 1500 m, Lahul and Spiti 3900 m, Sutlej Valley 2500-2800

m (Waite, JBNHS 45: 539), Garhwal 3600 m (Lavkumar, *ibid.* 53: 326), Kumaon (Walton, JASB 1900: 163), central Nepal 3600 m (Lowndes, JBNHS 53: 35), eastern Nepal, apparently only in the alpine zone, 4000–4500 m (Biswas, *ibid.* 58: 449; Diesselhorst, 1958), Mt Everest region 3600–4200 m (*Ibis* 1922: 516), Sikkim and Chumbi Valley from c. 2700 m up to nearly 5000 m (Hingston, JBNHS 32: 325; Sâlim Ali, *Birds of Sikkim*: 307), Bhutan 2400–3000 m (Ludlow, *Ibis* 1937: 516), Arunachal Pradesh and southeastern Tibet (*ibid.* 1944: 362). Affects river beds, rocky streams and wet fields. Winters mostly below c. 1500 m (a few individuals up to c. 2700 m), in the eastern parts extending to the plains of northern Bihar, northern Bengal, Assam, Nagaland, Manipur and Bangladesh (all parts — Rashid).

Extralimital. Breeds in adjacent parts of southern Tibet (northern limits unknown), Szechuan and Yunnan south to northern Vietnam. Winters south to Tenasserim, Thailand and Cambodia.

GENERAL HABITS, FOOD and VOICE. As in 1885.

Display. ‘The male shuffles round the hen with the tail and wing nearest the latter spread out and sloped downwards’ (HW).

BREEDING. *Season*, May to early August. *Nest*, a cup of dry grass, roots and leaves lined with hair, wool or feathers, placed under a boulder, among roots of bushes or in heaps of flotsam on river islands or banks, occasionally in holes in walls or under the eaves of houses. *Eggs*, 4 to 6, white tinged with grey marked with numerous brownish grey specks. Average size of 80 eggs 21.3 × 15.5 mm (Baker), of 10 eggs 21.9 × 15.6 mm (BBO). Building of nest, incubation and care of young by both sexes.

MUSEUM DIAGNOSIS. See Key to the Subspecies. Differs from *personata* in having the back and rump black. Female similar to male but black of back more or less mixed with grey. Postnuptial moult complete in August and September. Other moult as in 1885.

First-winter male. Upperparts and lesser coverts sooty black edged or mixed with grey; often shows more white on throat than adult. First-winter female like male but upperparts and lesser coverts dark ashy grey, somewhat darker on crown.

Young not distinguishable from that of *personata*. From *dukhunensis* distinguishable by more white in wing-coverts, darker ear-coverts, chin and throat sullied with dusky brown.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail

Weight 15 ♂♂ (Aug.–Nov.) 22–26.1; 10 ♀♀ (Aug.–Nov.) 20.1–23.7 g (GD).

COLOURS OF BARE PARTS. Iris dark brown. Bill black; mouth blackish in male, fleshy or blackish livid in female. Legs and feet black (HW).

1888. **Whitefaced Pied Wagtail.** *Motacilla alba leucopsis* Gould

Motacilla leucopsis Gould, 1838 (1837), Proc. Zool Soc. London: 78 (India)
Baker, FBI No. 1173, Vol. 3: 264

LOCAL NAMES. *Dhobân* (Hindi); *Khânjânâ*, *Gara chanchir* (Chota Nagpur); *Bâlimâti*, *Tipori* (Assam); *Tangchenfêu* (Lepcha).

FIELD CHARACTERS. As in Indian White Wagtail (1885), i.e. grey back and white sides of head, but easily distinguished from it by black streak through eye.

STATUS, DISTRIBUTION and HABITAT. Uncommon winter visitor to Assam, Nagaland, Manipur, Bangladesh and west to central Nepal (rare). Habitat as in 1888.

Extralimital. Breeds in Siberia from the Yenisey to Chuckchi Peninsula. Winters in southeastern Asia.

MIGRATION. Noted as common on passage in the Nepal Valley in March–April and October.

GENERAL HABITS, FOOD and VOICE. As in 1885.

BREEDING. Extralimital.

MUSEUM DIAGNOSIS. Dark eye-streak, present in all plumages, identifies this subspecies.

MEASUREMENTS

	Wing	Bill (from skull)	Tail
♂♂	92–101 }	16–18	{ 93–99 mm
♀♀	88–94 }		{ 86–95 mm
			(HW)

COLOURS OF BARE PARTS. As in 1885.

1890. **Swinhoe's Pied Wagtail.** *Motacilla alba baicalensis* Swinhoe

Motacilla baicalensis Swinhoe, 1871, Proc. Zool. Soc. London: 363
(Eastern Asia = Lake Baikal)
Baker, FBI No. 1169, Vol. 3: 260

LOCAL NAMES. None recorded.

SIZE. Bulbul; length c. 18 cm (7 in.).

FIELD CHARACTERS. As in Indian White Wagtail (1885), i.e. grey back and white sides of head, but chin and upper throat white at all seasons. Not distinguishable in winter.

STATUS, DISTRIBUTION and HABITAT. Uncommon winter visitor. ‘Assam’ (Baker), Bangladesh (all parts *vide* Rashid), Madhupur (Bihar), Sikkim, Bengal duars (Roonwal, *Rec. Indian Mus.* 41: 293), Nepal (Proud, JBNHS 53: 67) and probably farther west in the plains of northern India. According to Roonwal (*loc. cit.*) ‘in the Indian Museum there are a number of well-preserved skins of *baicalensis* (≧ *personata*) from as far west as Kashgar, Gilgit and Ladakh, and also from Simla and Sikkim’. Cf. also extralimital winter range and migration. Habitat as in 1888.

Extralimital. Breeds in Mongolia and Transbaikalia. Winters in the Indo-Chinese countries, southern China and in Afghanistan and southeastern Iran.

MIGRATION. Recorded on passage in Nepal both in March–April (latest 30 April) and in September (Proud, Biswas, Polunin, Diesselhorst), and presumably throughout the Himalayas (cf. Roonwal, above).

GENERAL HABITS, FOOD and VOICE. As in 1885.

BREEDING. Extralimital.

SIZE. Bulbul; length c. 18 cm (7 in.).

FIELD CHARACTERS. As in *alboides* (1887) black back but ear-coverts and sides of neck white. Distinguishable from *personata* (1886) by black back (c. grey), white sides of neck and white upper throat; *dukhunensis* has a grey back and black chin and throat.

STATUS, DISTRIBUTION and HABITAT. Common winter visitor. Assam, Nagaland, Manipur, Bangladesh and Bengal west through Bihar to eastern Uttar Pradesh and central Nepal (possibly Simla, cf. Beavan, *Ibis* 1868: 73, as ‘*luzonensis*’); in the terai, duars and foothills up to c. 1500 m, in the hills south of the Brahmaputra up to c. 1000 m. Also Andaman Islands. Affects dry river-beds, streams, ponds, roads and cultivation.

Extralimital. Breeds in western and northern China, Korea and Amurland. Winters in southern China and Indochinese countries.

MIGRATION. Occurs in winter quarters chiefly from mid September to the beginning of April. Common on passage at high altitudes in southern Tibet and eastern Himalayas from the middle of August to the middle of September (Ludlow, Diesselhorst); on Mt Everest up to 5300 m.

GENERAL HABITS, FOOD and VOICE. As in 1885.

BREEDING. Extralimital.

MUSEUM DIAGNOSIS. See Field Characters. Female as male but upperparts dark slaty usually mixed with some black (sometimes without any black or nearly as black as male).

First-winter male. Crown usually black, sometimes mixed with dark grey. Mantle and lesser coverts dark slate-grey, mixed or not with black to sooty black, fringed with dark grey. Flight-feathers and primary-coverts browner than in adult, greater coverts browner and only narrowly edged with white (retained from young).

First-winter female. Above brownish slate-grey. Crown like back or darker. Forehead less pure white than in adult or first-winter male.

Young as *dukhunensis* but rump blackish with narrow brown fringes. Median coverts white, grey at base and dark along shafts.

Plumages very variable. Those that resemble the grey-backed forms may be distinguished by the browner tinge of upperparts, darker rump and lesser coverts and large amount of white in median and greater coverts (HW).

Weight 5 ♂♂ (Sept.–Oct.) 20.2–27 g (GD).

COLOURS OF BARE PARTS. As in 1887.

1889. **Streaked Pied Wagtail.** *Motacilla alba ocularis* Swinhoe

Motacilla ocularis Swinhoe, 1860, *Ibis*: 55 (Amoy, China)
Baker, FBI No. 1170, Vol. 3: 261

LOCAL NAMES. As in 1888.

SIZE. Bulbul; length c. 18 cm (7 in.).

MUSEUM DIAGNOSIS. See Field Characters. White in wing-coverts more extensive than in *dukhunensis*, about as in *personata*. In winter plumage doubtfully differentiable from *dukhunensis*; larger size and larger amount of white in wing, especially median coverts, may be helpful characters.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	93–100 }	16–18	c. 24	{ 88–98 mm
♀♀	86–94 }			{ 88–94 mm
				(HW, Roonwal)

Weight 2 ♀♀ (Sept.) 22.8, 23.5 g (GD).

COLOURS OF BARE PARTS. As in 1885.

1891. **Large Pied Wagtail.** *Motacilla maderaspatensis* Gmelin

(*Motacilla maderaspatensis* Gmelin, 1789, Syst. Nat. 1: 961
(India = Madras *vide* Whistler & Kinnear, 1933, JBNHS 36: 842)
Motacilla maderaspatensis kangrae Koelz, 1939, Proc. Biol. Soc. Washington 52: 75
(Badhwar, Kangra District, Punjab)
Baker, FBI No. 1172, Vol. 3: 263
Plate 97, fig. 18

LOCAL NAMES. *Mârûlâ*, *Bhain mârûlâ*, *Khânjân* (Hindi); *Nachengli*, *Hata roui* (Chota Nagpur); *Bâlimâti*, *Tipechi* (Assam, all wagtails); *Khangrangchak* (Manipur, all wagtails; regarded as an incarnation of Durga); *Sakala varala-gâda* (Telugu); *Vannathi kûrûri*, *Kulathu kûrûri* (Tamil); *Vêlkumâlî pakshi* (Malayalam).

SIZE. Bulbul; length c. 21 cm (8½ in.).

FIELD CHARACTERS. A large black-and-white wagtail. Above, black with a conspicuous white supercilium from lores to nape, a large white band on wing and white outer rectrices. Below, throat and breast black, rest of underparts white, ashy on flanks. Sexes alike but female sometimes duller and browner. Summer and winter plumages alike.

Colour-pattern very similar to Magpie-Robin, but prominent white supercilium diagnostic.

The black-backed races of *M. alba* have a less extensive white patch on wing and an entirely white forehead; in *maderaspatensis* the black of crown projects in a point over forehead to base of bill.

STATUS, DISTRIBUTION and HABITAT. Common resident. The entire Indian Peninsula from the Himalayan foothills (Kohat, Salt Range and Punjab to Sikkim and Bengal duars) south through Kutch to Kanyakumari; lower Bengal and adjoining parts of Bangladesh. One old record (presumably before 1870) from Sri Lanka (Whistler, 1914). In the Himalayan foothills up to c. 900 m (Sikkim) and locally 1500 m (Garhwal, Kulu) or 1700 m (Nepal — Diesselhorst); in the hills of southern India up to 2200 m. Affects watercourses, preferably smooth-running rocky streams, and also dammed irrigation tanks, pools, masonry wells, and occasionally neighbouring rice paddies and lawns.

PIPITS AND WAGTAILS

297

GENERAL HABITS. Usually in pairs which hold together throughout the year. In winter may gather in flocks to roost in tamarisks or reeds in company with other wagtails and swallows. Feeds along the water's edge in typical wagtail manner, vigorously wagging its tail up and down during short stops. Often perches on roof-tops.

Display. As observed by SA: The male of a pair flies down to ground on hovering wings, singing lustily, his plumage fluffed out flaunting the contrasting colours. Lands in front of female, raises open both wings vertically back to back with only the tips quivering and breast-feathers fully puffed. Approaches female thus, with stiff mincing steps. She responds by a slight crouch and opening out of wings at the armpits, shivering them as in food-begging. Copulation ensues. Male with upraised wings continues to sing during the act and for several seconds after coming off female's back. Wings now lowered, but body-feathers still loosely fluffed. (Birds disturbed by passer-by.)

A probable sequence of the above described by another observer (Kirkpatrick, JBNHS 52: 602). After copulation on a flat roof-top [with the same preliminaries as above] the male moves away a few centimetres and suddenly springs upward in the air for a metre or so with a single rapid wing-beat. He slowly sinks back to the roof like a puff-ball on stiffly outspread wings, rump and belly feathers fluffed out, tail slightly spread and thrown well over back, legs dangling stiffly below, and the bird singing loudly all the time. As soon as he touches down he sidles up with a stiff mincing gait to the responsive female and copulation is repeated.

FOOD. Stomachs examined contained small beetles (Tridactylinae and others), locusts, dragonflies, snails and small seeds. To capture Tridactylinae beetles in sand, the birds often work in pairs and systematically search the sand. When the insect is spotted there is a swift rush, and a jet of sand is shot into the air as the prey is seized (Hingston).

VOICE AND CALLS. Call-note, a loud *chiz-zit* chiefly uttered in flight. Song, a clear high-pitched jumble of loud pleasant whistling notes somewhat reminiscent of Magpie-Robin's; sometimes also given by both sexes as a demonstration of anger or alarm on an intruder's approach to the nest. Song period in Nepal January to October, chiefly April to July (Proud).

BREEDING. Season, in the north March to May or June, rarely till September or October. In the south the season begins as soon as the rivers drop to dry-season level about the end of December and continues until the break of the rains in June (Betts). *Nest*, a rough collection of roots, coarse grass, scabs of dry algae and miscellaneous rubbish, in the centre of which is a neat cup lined with hair, wool, etc. Almost invariably placed in the vicinity of water, under bridges, in holes in walls or buildings, in hollows of stranded tree-trunks or among the roots of grass tufts growing out of rock overhanging streams; frequently in close proximity to nest of Wiretailed Swallow. A pair has been known to occupy a disused dipper's nest; another to place nest in a river ferry-boat in constant use. *Eggs*, normally 4, sometimes 3, rarely 5, greyish white with brown specks all over, denser round the large end, darker and browner than those of *M. alba*. Average size of 100 eggs 21.9 × 16.2 mm (Baker). Building of nest and care of young by both sexes. Incubation period undetermined.

298

MOTACILLIDAE

MUSEUM DIAGNOSIS. See Field Characters. Unlike *M. alba*, summer and winter plumages are alike. First-winter male and female alike, duller (browner) than adults. A complete moult about September; no spring moult. Female may have the upperparts dark sooty grey (cf. Whistler, JBNHS 38: 759).

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	91-103 (107)	19-20	27-28	93-107 mm
♀♀	88-103	18-20	26-28	90-103 mm

(HW, BB, SA, Koelz)

Weight 2 ♂♂ 30, 30; 1 ♀ 26; 1 ♂ 36 g (GD, BB, Roonwall).

COLOURS OF BARE PARTS. Iris dark brown. Bill black; mouth slaty black. Legs and feet blackish. In nestling gape pale yellow, mouth orange.

south. In the western Himalayan foothills breeds up to c. 1500 m, in Darjeeling district and Nepal to c. 2100 m; in Garhwal observed at 3000 m in June in clumps of rhododendron. May be seen at these higher elevations till October, withdrawing in winter to the foothills below c. 800 m. Affects

Dicaetum agile

Distributional ranges

1 *agile* (1892). 2 *zeylonense* (1893). 3 extralimital subspecies.

large flowering or fruiting trees and shrubs (especially those infested with the plant parasites *Loranthus* and *Viscum*) in a variety of biotopes — dry to moist-deciduous or semi-evergreen forest and cultivated country — orchards, village groves and suburban gardens.

Extralimital. Northern Burma. The species ranges east through the Indochinese countries, Malaysia, Lesser Sunda and Philippine islands.

GENERAL HABITS. Keeps singly or in pairs, hopping restlessly about the foliage, carefully searching the end twigs or petioles and underside of the leaves, or flying from one plant parasite clump to another within its accustomed beat. Has a characteristic habit of twitching the stumpy square tail from side to side.

FOOD. Chiefly figs of peepul (*Ficus religiosa*), banyan (*F. bengalensis*), gulair (*F. glomerata*), and berries of *Lantana*, *Bridelia*, *Viscum* and *Loranthus* but somewhat less closely dependent upon the last than other flowerpeckers, e.g. 1899. Instead of swallowing *Loranthus* berries entire, like *D. erythrorhynchos*, it usually revolves them in the finch-like bill to strip them of the edible epicarp and wipes off the viscous seeds on to the perch or adjoining branches. Thus it helps to spread the parasite over the same host-tree rather than disseminate it farther afield. Also fond of the nectar of *Bombax*, *Erythrina*, and other blossoms, and the juicy flesh of mhowa (*Madhuca indica*) flowers. Spiders are also taken, and presumably various insects.

	Page

(Kohima, Assam)

Baker, FBI No. 1311 (part), Vol. 3: 435

Plate 98, fig. 1

LOCAL NAMES. *Phul sūnghāni* (Gujarati); *Che* (Chota Nagpur); *Chitta-jitta* (Telugu); *Itakkannikkūūi* (Malayalam).

SIZE. Sparrow —; length c. 9 cm (3½ in.).

FIELD CHARACTERS. A drab stumpy-tailed flowerpecker with a short, thick bill. Above, olive-grey, greener on rump. A narrow white terminal band on tail. Below, greyish white faintly brown-streaked on breast. Sexes alike.

The bluish almost finch-like bill and orange-red eyes are diagnostic.

STATUS, DISTRIBUTION AND HABITAT. Common resident; in the Himalayan foothills a vertical migrant. The Indian Peninsula from the outer Himalayas (western Punjab (Rawalpindi) to Bhutan and Assam north and south of the Brahmaputra with Meghalaya and Nagaland). South through Gujarat (Gir Forest, JBNHS 66: 378) to Kerala (Peermade, Maraiyur), and on the eastern side through Bengal, Orissa, Andhra Pradesh and Tamil Nadu south at least to the Shevaroy Hills c. 11°N. (SA). No records from farther

DICAETIDAE

VOICE AND CALLS. Call-notes a sharp metallic *chik, chik, chik*... similar to but easily distinguishable from those of *D. erythrorhynchos*. While uttering these, spreads out tail and screws it nervously from side to side.

BREEDING. Season, overall January to June, but mostly early in the season when the trees are still bare, somewhat later in the hills. Nest, a hanging oval purse about 10 cm long with the roof slung for 8 cm or so along a twig; the entrance somewhat elongated horizontally, about 2 cm in length and immediately below the supporting twig. Built of a peculiar reddish brown vegetable down mixed with cocoons compacted into a soft, pliable and resilient felt; structure resembles that of *D. erythrorhynchos* in shape but instead of being hidden in a bunch of leaves it is usually fully exposed near the tip of a bare twig. Despite this, its cryptic coloration makes it look so deceptively like a dry rolled-up leaf that it eludes casual notice. Frequently builds among the leaf nests of the vicious red ant (*Oecophylla*) without apparent harm, and possibly for protection. Nest suspended at heights varying from two to nine metres on large- or medium-sized trees, usually quite high. Eggs, normally 3, sometimes 2, rarely 4, pale pink with reddish brown speckles and blotches. Average size of 76 eggs 15.9 × 11.5 mm (Baker). Building of nest, feeding young and nest sanitation by both sexes; share in incubation, and period, undetermined.

MUSEUM DIAGNOSIS. See Key to the Species and Subspecies.

MEASUREMENTS	Wing	Bill (from skull)	Tarsus	Tail
♂♂	55-65	10	14-15	31-34 mm
♀♀	58-64	9-10	13-14	27-30 mm

(Koelz, HW, SA, Rand & Fleming)

Weight 11 ♂ ♀ 7.5-11 (av. 9) g — SA. 1 ♂ 8.5 g (GD). 1 ♀ 8 g — SDR.

COLOURS OF BARE PARTS. Iris orange-brown or orange-red. Bill horny grey, dusker on upper mandible; mouth bright yellow and pink. Legs and feet dark slate. In fledgling bill brown, gape yellow.

1893. **Ceylon Thickbilled Flowerpecker.** *Dicaetum agile zeylonense* (Whistler)

Piprisoma agile zeylonicum Whistler, 1914, *Spolia Zeylanica* 23: 210

(Kumbalgamuwa, Ceylon)

Baker, FBI No. 1311 (part), Vol. 3: 435

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 9 cm (3½ in.).

FIELD CHARACTERS. As in 1892, q.v.

STATUS, DISTRIBUTION AND HABITAT. Sri Lanka, widely distributed in small numbers, in the hills up to c. 1200 m and in the northern forest tract. Affects tree-tops in forest and well-wooded areas. Keeps to a higher stratum than Tickell's Flowerpecker.

GENERAL HABITS. As in 1892.

FOOD. Spiders, insects, berries, fruit and nectar. Nestling in early stage fed mostly on berries and fragments of succulent fruit; later spiders (mostly) and insects are given.

VOICE AND CALLS. As in 1892.

FLOWERPECKERS

5

BREEDING. Season, February to August. Nest and eggs as in 1892; clutch size 2.

MUSEUM DIAGNOSIS. Differs from *agile* (1892) in, being darker, rump more olive, less yellow. Postnuptial moult complete.

MEASUREMENTS

Baker, FBI Nos. 1301 and 1302, Vol. 3: 426, 427
Plate 98, fig. 5

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 9 cm (3½ in.).

FIELD CHARACTERS. A flowerpecker with distinctly streaked underparts. Above, olive-green; wings and tail dark brown. Below, buffish white streaked with dark brown. A dark moustachial streak. Under tail-coverts bright yellow. Sexes alike.

The streaked underparts identify this species.

STATUS, DISTRIBUTION AND HABITAT. Resident, common south of the Brahmaputra. The Himalayan foothills from Nepal (one Hodgson record)¹ east through Darjeeling, Sikkim, Bhutan and (?) Arunachal Pradesh, the Patkai Range, Meghalaya, Nagaland, Manipur south to Tripura, Mizo Hills and the Chittagong Hill Tracts; apparently only in the hills, up to over 1200 m, in Sikkim to over 2000 m. Affects open jungle, edges of forest and orange orchards.

Extralimital. Ranges east to Vietnam. Nominate subspecies in Malaysia, Sumatra, Java and Borneo.

GENERAL HABITS. Those of the genus.

FOOD. Berries, especially *Loranthus*, flower-nectar, small beetles and other insects.

VOICE AND CALLS. Unrecorded.

BREEDING. Season, April to July. Nest, similar to that of other flowerpeckers; scraps of moss are often used on the exterior and more grass or fibre incorporated to support the vegetable down; nest usually placed under c. 6 metres. Eggs, 2 or 3, similar to others of the genus. Average size of 16 eggs 15.3 × 11 mm (Baker). Building of nest and incubation by both sexes.

MUSEUM DIAGNOSIS. See Field Characters.

¹ Rediscovered in 1973 along Tamur river, southwest of Dhankuta, c. 300 m, in SE Nepal (R. L. Fleming, Jr., Nepal Nature Conservation Society Newsletter No. 22: 4, January 1974).

FLOWERPECKERS

7

Female. Like male but black replaced by olive-brown, paler on sides of head, neck and breast. Middle of chin, throat and breast greyish white. Belly and under tail-coverts yellow.

STATUS, DISTRIBUTION AND HABITAT. Status and distribution little known. Scarce resident, local and subject to vertical movements. The Himalayas from Almora (Prater, JBNHS 42: 187) east through Nepal (cf. Biswas, 1963 and Diesselhorst, 1968), Sikkim (SF 2: 455, SF 5: 348; cf. also Sálím Ali, *Birds of Sikkim*: 356), Bhutan (?) and Arunachal Pradesh (Joonkotollee, Dibrugarh dist., specimens in British Mus.), thence south through Nagaland

Dicaeum melanoxanthum and *D. vinctus*

□ *D. melanoxanthum* (1896). ■ *D. vinctus* (1897).

(SF 11: 85) and Manipur (British Mus.). Obtained in summer at 2000 m (Almora), 2400 m (Nepal), 2700 m (Sikkim) and up to 3600 m *vide* Salomonsen in Peters's Check-list 12: 179; recorded in winter at c. 1400 m (Nepal Valley) and between 1600 and 1800 m (Sikkim). Affects tall trees in open forest and clearings in dense forest.

Extralimital. Ranges east to northern Yunnan, the Shan States of Burma, northern Thailand and extreme northern Vietnam.

GENERAL HABITS. Little known. A lively but apparently elusive bird frequenting the foliage of tall trees and climbers, visiting flowers, creeping in and out in incessant motion. Has been observed to make sallies from dead branches after insects in flycatcher style. Usually solitary and silent.

FOOD. Probably as of other flowerpeckers.

VOICE AND CALLS. Unrecorded.

BREEDING. Unknown.

MUSEUM DIAGNOSIS. See Field Characters.

6

DICAIEIDAE

Dicaeum chrysorrheum

Distributional ranges

□ *D. chrysorrheum* (1895), ■ *D. chrysorrheum* (RE).

Young, like adult but underparts more greyish; streaks finer, less defined. Upperparts rather less bright. Postjuvénal moult of body-feathers and probably all coverts except primary series.

1897. **Legge's Flowerpecker.** *Dicaeum vinctus* (Sclater)

Prionochilus vinctus Sclater, 1872, Proc. Zool. Soc. London: 730 (Ceylon)

Baker, FBI No. 1310, Vol. 3: 434

Plate 98, fig. 6

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 9 cm (3½ in.).

FIELD CHARACTERS. Male. Above, slaty blue. Wings and tail black, the latter with large white terminal spots. Below, throat white, belly bright yellow.

Female. Above, head grey. Back dull olive. Wings and tail dark brown; terminal spots on rectrices smaller than in male. Below, throat whitish; belly pale yellow, flanks olive.

STATUS, DISTRIBUTION AND HABITAT. Widely distributed in small numbers in the Wet zone of Sri Lanka up to c. 900 m. Affects foliage of tall trees and creepers entwining their trunks in rain-forest.

GENERAL HABITS. Keeps solitary, in pairs or in small family parties. Frequents mainly the tops of tall trees.

FOOD. Nectar, berries, spiders and small insects.

VOICE AND CALLS. Call-notes described as 'tchip', 'tchip-twee-see-see'; also has two types of song, one of which, the breeding song, is uttered, often during stormy southwest monsoon weather, from exposed twigs high up in tall trees' (Cicely Lushington).

BREEDING. Season, February to June, occasionally in July and August. Nest, a small pear-shaped structure with the entrance near the top sheltered by an eave projecting about 2 cm and suspended from a twig; rather similar to that of Tickell's Flowerpecker (1899) but larger, more neatly built and reddish brown in general colour. Material consists of fine, very soft vegetable down felted with cobweb into a fine wool-like material, on the outside of which are fastened many pieces of reddish sheaths from leaf-buds, some of the larger pieces hanging down below the nest, loosely attached by one end. The whole nest resembles a dead leaf and is very difficult to make out without powerful binoculars as it is placed high up among the foliage at the end of a branch of a large tree, from c. 18 up to 37 metres

FLOWERPECKERS

9

above the ground. Eggs 2, white profusely speckled with small blotches, spots and specks of purplish brick-red with underlying lavender markings of the same type. One egg measured 15.4 x 11.2 mm (Phillips). Building of nest and incubation apparently by female only, the male spending much of his time singing nearby. The nest is so well insulated that during the heat of the day the female often leaves it for long intervals (Lushington, C., JBNHS 42: 186; Phillips, W. W. A., *Ceylon Jour. Sci.* 24: 18-20).

MUSEUM DIAGNOSIS. See Field Characters. Postnuptial moult complete, August to October.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
2. ♂♂	58, 59	12	(10), 12	28, 31 mm
♀♀	56-59	c. 12	c. 13	26-30 mm

(HW, SDR)

COLOURS OF BARE PARTS. Iris brown. Bill: upper mandible black, lower blue-grey on basal half. Legs and feet black.

1898. Orangebellied Flowerpecker. *Dicaeum trigonostigma rubropygium* Baker

Dicaeum trigonostigma rubropygium Baker, 1921, Bull. Brit. Orn. Cl. 41: 108 (Mergui)

Baker, FBI No. 1300, Vol. 3: 425

Plate 98, fig. 7

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 9 cm (3½ in.).

FIELD CHARACTERS. Male. Above, slaty with bright orange back and rump. Below, throat pale grey; rest of underparts bright orange.

Female. Above, olive-grey; lower rump orange. Below, throat and flanks grey tinged with olive. Abdomen yellow.

STATUS, DISTRIBUTION AND HABITAT. Scarce and very local resident. The submontane tracts of the Lakhimpur district, eastern Assam (Baker) and in the Sunderbans (Ripley, *Synopsis*: 581). Affects glades and margins of evergreen forest.

Extralimital. Southern Burma, Malaysia, Indonesia and the Philippines.

GENERAL HABITS. Those of the genus.

FOOD. Unrecorded.

VOICE AND CALLS. Unrecorded.

BREEDING. Season, April and May. Nest and eggs similar to those of other members of the genus; nest usually placed on a high tree c. 10 or 12 metres above the ground. Average size of 10 eggs 15.5 x 11.2 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters.

MEASUREMENTS

(Baker)

Bill from skull c. 13 mm

FLOWERPECKERS

11

of Uttar Pradesh to the Jalpaiguri duars and Bhutan foothills and through Assam to Dibrugarh and North Cachar, south to Bengal, Bangladesh, Bihar and the Indian Peninsula from Jabalpur and Baroda south to Kanyakumari (Cape Comorin). In Nepal occurs up to c. 1400 m in summer, withdrawing from this level in winter. In the hills of southern India occurs up to the summits, but is more abundant in the plains. Affects deciduous forest, forest plantations, groves of mango and other orchards, and fig trees in open country or cultivation; sometimes coastal mangroves. Local distribution almost entirely dependent on the presence or absence of plant parasites of the mistletoe family (Loranthaceae).

Extralimital. Occurs very locally in Burma south to Tenasserim.

GENERAL HABITS. Keeps singly or in pairs; occasionally in small loose parties of 4 or 5 individuals. Incessantly on the move, flitting restlessly among the parasite clumps or darting from tree to tree. Frequents the foliage canopy of trees, seldom coming down to bushes. Very strong on the wing; flies high and rapidly for long distances in a series of dips and bounds. Has regular 'beats' or feeding territories of infested host-trees — in effect parasite plantations raised and maintained by the bird's own activities.

FOOD. Predominantly berries of parasitic *Loranthus* and *Viscum* spp. Along with other flowerpeckers is largely responsible for the dispersal of their seeds and thus for considerable damage and economic loss in forest plantations (teak, sal, etc.) and orchards (mango, guava, etc.). The ripe berries are either swallowed entire or the viscous contents squeezed out in the mandibles and the peel discarded. The undigested slimy seeds pass through the body with great rapidity and adhere to the branches on which they are excreted, sprouting in a few days and sucking the sap of the host. Spreads the infestation over a wide area rather than to adjacent branches of the same tree, cf. 1892.* Also takes other berries and fruit, nectar, spiders and small insects.

VOICE AND CALLS. A sharp, almost incessant *chik-chik-chik* uttered while hopping about and in flight. A series of twittering notes in the nature of a song (SA). A call like a cricket's reel and a piercing alarm-note *utit*, *utit* (Lowther).

BREEDING. Season, in the north February to June, in the south February to May and again in August-September (Betts). Nest, a small oval purse of fine grass, vegetable down, pieces of bark, green moss and cocoons; resembles that of the Purple Sunbird but lacks the 'porch' over the entrance and the trailer of rubbish dangling underneath. It is suspended from the tip of a twig from c. 3 to 12 metres above the ground and well hidden in a bunch of leaves. Eggs, 3 more usually than 2 [Lowther, Bihar (Manbhum district)], white, unmarked. Average size of 30 eggs 14.4 x 10.5 mm (Baker). Building of nest, care of young and probably also incubation, by both sexes. Incubation period undetermined. Nest-young fed largely on peeled loranthus berries.

* For structure etc. of alimentary canal see H. Desselberger (1931) 'Der Verdauungskanal der Dicaeiden', J. Orn. Soc. (1): 353-70.

* For details see Salim Ali (1931) 'The role of sunbirds and flowerpeckers in the propagation and distribution of the tree-parasite *Loranthus longiflorus* Desr. in the Konkan (W. India)', JBNHS 33: 144-9.

10

DICAETIDAE

COLOURS OF BARE PARTS. Male. Iris brown. Bill black. Legs and feet horny black. Female. Iris grey to brown. Bill: base of upper mandible reddish brown; tip of both mandibles blackish horn; rest of lower mandible orange-brown to orange-vermilion (HW MS.).

Baker, FBI No. 1306, Vol. 3: 430

Plate 98, fig. 4

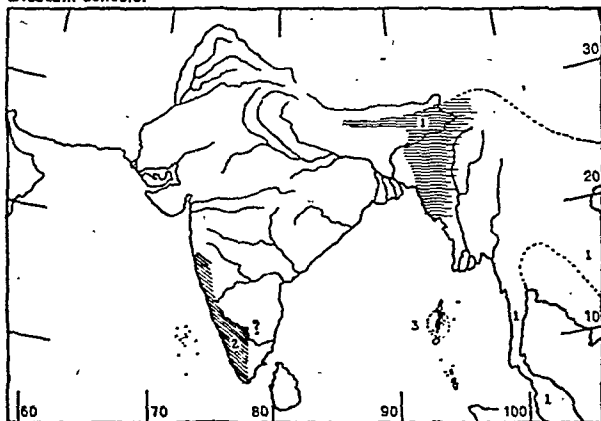

LOCAL NAME. *Bongfang daotisha* (Cachari).

SIZE. Sparrow —; length c. 8 cm (3 in.).

FIELD CHARACTERS. A small plain-coloured flowerpecker, olive-brown above, greyish white below.

Very similar to *erythrorhynchus* (1899) but recognizable at close range by blackish bill and pale lores and supercilium.

STATUS, DISTRIBUTION and HABITAT. Common resident. The Himalayan foothills from central Nepal east through Sikkim, northern Bengal, Bhutan and Arunachal Pradesh, thence south through the plains and hills of Assam, Meghalaya, Nagaland and Manipur south to the Chittagong Hill Tracts.

Dicaeum concolor

Distributional ranges

1 *olivaceum* (1901). 2 *concolor* (1902). 3 *virens* (1903).

Occurs mostly in the hills, in the Himalayas up to at least 1400 m, in Arunachal up to 1800 m, but more common between 700 and 1000 m. Affects groves of trees in open country, orange orchards, outskirts of forest, wide glades and sides of streams in forest.

Extralimital. Ranges east through the Indochinese countries and southern China to Kwangtung. Other subspecies in Taiwan, Hainan, Malaysia, Borneo, the Sunda Islands and the Andamans. A disjunct population (nominate) in southwestern India.

GENERAL HABITS. Usually keeps in pairs, though several pairs may be seen feeding on the same tree. A very energetic, restless species turning

FLOWERPECKERS

15

groves of trees in the vicinity of villages. Inseparable from the tree parasites (family Loranthaceae).

Extralimital. Range of this subspecies widely disjunct from that of *olivaceum* (1901) [Assam].

GENERAL HABITS. As in 1901.

FOOD. As in 1901.

VOICE and CALLS. 'Call, a sharp *cheek*; sometimes a rapid series of ticks. Song, a high-pitched trill, weak and wiry' (Nichols). Voice and notes indistinguishable from those of Tickell's Flowerpecker (SA).

BREEDING. Season, January to April with second broods in May and June. Nest and eggs, as in 1901. Average size of 20 eggs 14.7 × 10.6 mm (Baker).

MUSEUM DIAGNOSIS. See Key to the Subspecies.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	45-52	12-13	c. 13	{ 23-26 mm c. 25 mm (Koelz, HW, SA)
♀♀	44-52			

Weight 15 ♂♀ 5.8 (av. 6.2) g — SA.

COLOURS OF BARE PARTS. Iris brown. Bill bluish grey, dark horny brown on culmen; mouth grey, brownish and pink. Legs, feet and claws brownish black.

1903. Andaman Flowerpecker. *Dicaeum concolor virens* Hume*Dicaeum virens* Hume, 1873, Stray Feathers 1: 482

(Neighbourhood of Port Blair, Andamans)

Baker, FBI No. 1307, Vol. 3: 431

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 8 cm (3 in.).

FIELD CHARACTERS. As in 1901, q.v.

STATUS, DISTRIBUTION and HABITAT. Common resident in South and Middle Andaman islands. Affects trees parasitized by *Loranthus*.

GENERAL HABITS, FOOD and VOICE. As in 1901.

BREEDING. Unrecorded, probably as in 1901. A female with mature ovary and distended oviduct, 20 March (Abdulali, JBNHS 58: 411).

MUSEUM DIAGNOSIS. Very similar to *concolor* (1902) but brighter and greener than it or *olivaceum* (1901). Lores whitish but no white on forehead and a mere trace of a supercilium. Below, differs from both the above races in having the abdomen bright pale yellow contrasting with the pale grey of breast.

MEASUREMENTS and COLOURS OF BARE PARTS. As in 1902.

1904. Scarletbacked Flowerpecker. *Dicaeum cruentatum cruentatum* (Linnaeus)*Certhia cruentata* Linnaeus, 1758, Syst. Nat., ed. 10, 1: 119 (Benghala)

14

and twisting about in every kind of attitude while searching leaves, blossoms and parasitic plants for insects, nectar and berries.

FOOD. Berries, especially of the Loranthaceae, nectar, insects and spiders. VOICE and CALLS. When feeding utters the usual twitter of the genus, and when flying from one tree to another a constant *chip, chip, chip* (Baker). 'Very noisy as they pour out their trill from the top of lofty trees.'BREEDING. Season, March to August, chiefly May and June. Nest, a very small hanging purse (c. 5 × 7 cm) made mostly of the silky whitish floss of *Salmalia malabarica*, usually placed on trees between c. 6 and 12 metres above the ground, sometimes in high bushes or in low plants growing among weeds, nettles and briars. Eggs, 2 or 3, white, unmarked. Average size of 40 eggs 14.5 × 10.6 mm (Baker). Building of nest, incubation and care of young by both sexes. Incubation period undetermined.MUSEUM DIAGNOSIS. Differs from *concolor* (1902) in being more olive-green above and on edges of wings; underparts rather duller and more ashy with a slight buffy yellow tinge. In worn plumage the olive-green is lost and the differences are far less.

Young, like adult but upperparts a little browner, less olive; underparts more ashy.

MEASUREMENTS

Baker, FBI Nos. 1304 and 1305, Vol. 3: 429, 430

LOCAL NAME. *Itikkamikkiruvu* (Malayalam).

SIZE. Sparrow —; length c. 8 cm (3 in.).

FIELD CHARACTERS. As in 1901, q.v. Very similar to co-existing Tickell's Flowerpecker (1899) but somewhat dumper; distinguished also by blackish (v. pinkish) bill, white shoulder of closed wing, and yellowish white underparts.

STATUS, DISTRIBUTION and HABITAT. Common resident. Southwestern India from Mahabaleshwar south through western and southern Karnataka, Kerala and western Tamil Nadu east to the Shevaroy (Yercaud — SA), in the low country and hills up to the summits but more abundant in the foothills up to c. 1000 m. Affects deciduous and mixed deciduous-and-evergreen forest, clearings in and about tea and coffee plantations, and

DICAIEIDAE

16

FIELD CHARACTERS. Male. Above, crown, back and rump crimson. Sides of head black. Wings and tail glossy blue-black. Below, centre of throat, breast and belly pale buff. Sides of throat and breast black, flanks grey.

Female. Above, olive. Upper tail-coverts crimson. Tail black. Wings dark brown. Below, buff with grey sides.

STATUS, DISTRIBUTION and HABITAT. Common resident. The Himalayan foothills from eastern Nepal (not recorded since Hodgson), east through Darjeeling, Sikkim, Bhutan and Arunachal Pradesh, south in the plains and hills through Bengal (Jalpaiguri dist., Calcutta, Sunderbans), the

Dicaeum cruentatum

Distributional range

Brahmaputra Valley, Nagaland, Manipur and south to Dacca, Comilla and the Chittagong region. In the hills up to c. 1400 m. Affects open forest, orchards, and groves of trees in cultivation.

Extralimital. Ranges east through the Indochinese countries and southern China to Fukien. Other subspecies in Sumatra, Borneo and small neighbouring islands.

GENERAL HABITS. Those of the genus. Generally keeps to the tops of high trees but will often come down to bushes when abundance of food

FLOWERPECKERS 17

attracts. Favourite hunting grounds are dense clusters of parasitic plants (Loranthaceae).

FOOD. Insects, spiders, berries and nectar. Has been observed hawking flying insects from a perch in a tree and hovering motionless to capture them (Roseveare).

VOICE and CALLS. Call-note, a surprisingly loud *chik-chik* reminiscent of the Tailor Bird's (1535) or Streaked Fantail Warbler's (1498). Also a constant twittering while feeding. 'A series of sharp notes most nearly imitated by drawing the point of a nail or hard-pointed substance in a series of jerks over a glass pane' (Davison, SF 6: 192).

BREEDING. Season, April to August, chiefly May and June. Nest, an oval purse of vegetable down kept together, by shreds of grass, rootlets and cobweb. The rather broad entrance near the top occasionally has a downy 'porch' projecting above it. Size of nest c. 9 x 6 cm. It is suspended on a twig at the end of a branch but well hidden by leaves, at heights varying from 2 to 15 metres, usually between 6 and 9 metres. Eggs, 2 or 3, unmarked white. Average size of 40 eggs 14.4 x 10.3 mm (Baker). Building of nest and incubation by both sexes; period of incubation 10 or 11 days.

MUSEUM DIAGNOSIS. See Field Characters. Postnuptial moult complete, June to September. Some body moult in February. Postjuvinal moult of body-feathers, lesser, median and most greater coverts, tertials and tail.

MEASUREMENTS

	Wing	Tarsus	Tail
♂ ♀	46-51	c. 13	25-28 mm (Baker)

Bill from skull c. 12 mm
Weight 3 ♂♂ 7-8 g (SA).

Genus ANTHREPTES Swainson

Anthreptes Swainson, 1837, Nat. Hist. Class. Bds. 2: 329.

Type, by monotypy, *A. javanica* Horsfield = *Certhia malaccensis* Scopoli

Chalcoparia Cabanis, 1851, Mus. Hein. 1: 103.

Type, by original designation, *Sylta singalensis* Gmelin

Cf. Delacour, J., 1944, *Zoologica* 29: 17-38. (Review of family)

Bill shorter than, or equal to head, nearly straight. Nostrils operculated, exposed. First primary (as.) short. Tail square or slightly rounded, shorter than wing. Tarsus entirely covered with scales.

1906. Rubycheek. *Anthreptes singalensis rubinigenis* (Baker)

Chalcoparia singalensis rubinigenis Baker, 1930 (23 April, or more probably 14 March) [cf. Biswas, JBNHS 60: 684], Fauna Brit. Ind., Bds. 7: 282, new name for *Chalcoparia singalensis lepida* (Latham), cited in Baker, 1926, FBI 3: 370 (India, restricted to Cachar), nec *Certhia lepida* Latham, 1790, nor *Certhia lepida* Sparrman, 1787 = *Certhia malaccensis* Scopoli, 1786

Chalcoparia singalensis assamensis Kloss, 1930 (7 May), Bull. Brit. Orn. Cl. 50: 69-70, new name for *Chalcoparia singalensis lepida* (Latham), cited in Baker, 1926 (FBI 3: 370) Baker, FBI No. 1258, Vol. 3: 370
Plate 99, fig. 3

LOCAL NAME. *Daotisha sindai* (Cachar).

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. Male. Above, brilliant metallic green. Ear-coverts copper coloured, bordered below by a brilliant violet-purple line. Below, throat and breast rufous; rest of underparts lemon-yellow.

Female. Above, olive-green, yellowish on wing. Below, like male.

Young, like female but throat yellow.

STATUS, DISTRIBUTION and HABITAT. Common resident. Extreme eastern Nepal (Ripley 1950, Fleming & Traylor 1964) east through Darjeeling, Sikkim, Bhutan, Assam, Nagaland, Manipur and Bangladesh south to Dacca. Affects open forest, scrub jungle and glades or tracks in dense evergreen forest, in the foothills up to c. 700 m and in adjacent plains, but does not seem to wander away from broken ground.

NECTARINIIDAE 18

lower) and 2100 m (Kangra), 2700 m (Nepal — Polunin), 3000 m (Sikkim fide Stevens), 2300 m (Bhutan). In winter occurs between c. 600 m and 1200 m (Kangra), 900-2300 m (Nepal), 750-2000 m (Sikkim) and from the foothills to 2000 m in Arunachal. In Nagaland occurs between 750 and 2500 m, in Meghalaya up to at least 1800 m. Affects subtropical evergreen or deciduous forest; inseparable from the parasitic *Loranthus* clumps on tall trees. Also secondary growth, and trees in orchards and cultivation.

Extralimital. Ranges east through N. Burma and the northern Indochinese countries and China to Hupeh and Fukien. The species ranges south to Sumatra and Cambodia, and east to the Philippines and Taiwan.

GENERAL HABITS. Keeps singly, or in pairs in the breeding season, doing the rounds of *Loranthus*-laden trees, hopping energetically among the parasite clusters. Sometimes in small parties in winter, joining up with flocks of other small birds wandering from tree to tree in the forest.

FOOD. Insects, spiders, nectar and berries, especially of the mistletoe family Loranthaceae.

VOICE and CALLS. A single clicking *chip* uttered in flight. Song, a long continuous series of clicks uttered from a perch while swaying its body from side to side (Smythies); also described as a shrill *titty-titty-titty*... recalling the noise of the rapid opening and closing of a pair of scissors (HW). Song period in Nepal, mid February to June (Proud).

BREEDING. Season, March to June. Nest, as in 1904, placed in trees between 3 and 9 m above the ground. Eggs, 2 or 3, white. Average size of 18 eggs 14.8 x 10.3 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters. Juvenile (♀). Chin and throat white. Buff on underparts much paler and duller than in adult (Biswas).

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	46-53	9-12	12-14	25-30 mm
♀♀	45-49			23-26 mm (BB, SA)

Weight 16 ♂♂ 4-8 g; 5 ♀♀ 5.5-6.1 g (SDR, GD, SA).

COLOURS OF BARE PARTS. Iris brown. Bill black with a patch on the base of lower mandible — whitish in male, yellow to orange in female. Legs, feet and claws dark horny.

Family NECTARINIIDAE: Sunbirds

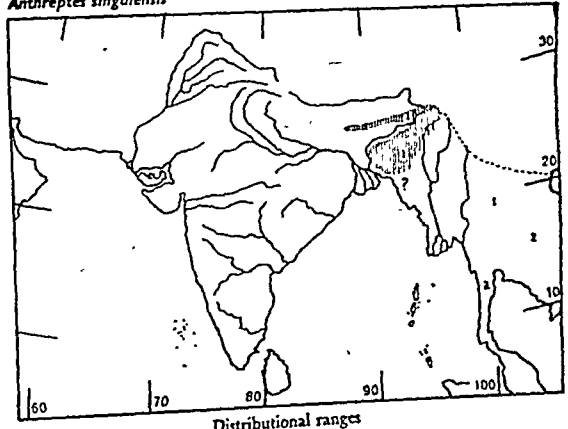

For description see Baker, E. C. Stuart, 1926, FBI 3: 372 (excludes *Anthreptes*); Van Tyne, J. & Berger, A. J., 1959: 539; Bannerman, D. A., 1964, article 'Sunbird' in Thomson, A. L. (ed.), *A New Dictionary of Birds*, London and New York

A sunbird's bill, showing finely serrated mandibles

NECTARINIIDAE 20

Anthreptes singalensis

1 *rubinigenis* (1906). 2 extralimital subspecies.

Extralimital. Extends east to northern Thailand. The species ranges throughout the Indochinese countries, Malaysia, Borneo and the Sunda Islands.

GENERAL HABITS. Keeps singly, in winter sometimes in small parties, moving and working together like a flock of tits. Flits actively around bushes and trees searching the leaves for insects or probing into blossoms for nectar. Actions somewhat reminiscent of White-eye (*Zosterops*, 1933).

FOOD. Insects and nectar.

VOICE and CALLS. A shrill and rather loud chirp when flying from one bush to another.

BREEDING. Season, end of March to June. Nest, a pear-shaped structure of very fine fibres mixed with fern stalks and lined with the same material; the rather large entrance is protected by an overhanging porch. The nest is suspended on small drooping twigs of bushes within a couple of metres above the ground. Eggs, 2, white speckled with brown-grey. Average size of 8 eggs 16.9 x 12 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	—	15-17	15-17	41-43 mm
♂♀	52-55			
♀♀	—	14-16		(Baker, MD, SA)

COLOURS OF BARE PARTS. Iris red. Bill blackish. Legs and feet greenish grey.

SUNBIRDS

21

Genus NECTARINIA Illiger

Nectarinia Illiger, 1811, Prodrum: 210.Type, by subsequent designation, *Certhia farnosa* Linnaeus*Cinnyris* Cuvier, 1817, Règne Anim. 1: 411.Type, by subsequent designation, *Certhia superba* Shaw*Chalcostetha* Cabanis, 1851, Mus. Hein. 1: 103. Type, by original designation,*Ch. pectoralis* Temm. = *Nectarinia chalcostetha* Jardine*Leptocoma* Cabanis, 1851, Mus. Hein. 1: 104. Type, by original designation,*L. zeylonica* = *Certhia zeylonica* Linnaeus

Bill much longer than head, strongly curved and pointed. Nostrils operculated, exposed. No rictal bristles. First primary (as.) short. Tail shorter than wing, square or slightly graduated. Tarsus anteriorly covered with transverse scales. Plumage of male with metallic colours.

SUNBIRDS

23

secondary jungle and dry cultivated country in the neighbourhood of villages with tamarind and babool trees, cactus hedges and gardens; prefers deciduous biotope.

Extralimital. Extends to Arakan, Burma (Smythies).

GENERAL HABITS AND FOOD. Not different from other sunbirds, e.g. the Purple, 1917. Usually keeps in pairs the year round. Hops and flits vivaciously among foliage and flower-clusters searching for small insects and nectar, clinging to the branchlets in all manner of acrobatic positions to probe the corollas, sometimes hovering momentarily in front of a sprig to take a spider, or cobweb for nest. Territorial and very pugnacious, especially on its feeding tree. Nectar of large-petalled flowers which preclude access by direct probing with bill is reached by a short-cut through a hole pierced at the base of the calyx. For its role in the propagation of the mischievous *Loranthus* tree-parasite see Salim Ali (1931).

VOICE AND CALLS. Song, a sharp twittering *tityou, tityou, tityou, tr-r-r-tit, tityou*, etc. uttered while hopping about and feeding among flowers. Also a feeble mousy *Sisiree, sisiree*... almost identical with that of Small Sunbird (1909) given from a perch while the bird pivots from side to side and excitedly opens and shuts its wings and tail (SA).

BREEDING. Season: Nests are found in every month, but a period of increased breeding activity occurs from March to May in Bengal and from February to April in southern India, with a second peak from July to September in the latter region where the species breeds freely after the monsoon. Nest, a pear-shaped or roundish oval purse composed mostly of grass and other fibrous material mixed with a variety of oddments, lined with soft vegetable down and draped on the outside with bits of lichen, bark, caterpillar frass, moss, broken leaves and other rubbish fastened with cobweb. Most nests, but not all, have a porch-like projection over the entrance. Nest very much like that of *N. asiatica* and almost impossible to distinguish; placed from as low as a couple of metres, sometimes up to 12 or 15, in trees and shrubs. Usually suspended at the tip of a branch, often in creepers growing on the trellis-work of verandas; sometimes even on pendent electric light bulbs and sockets, or a wire dangling from the ceiling actually within a bungalow, regardless of the movements of the inmates. Eggs, nearly always 2, very exceptionally 3, grey with a greenish or buff tinge, flecked and speckled with greyish brown, more profusely around the broad end. Average size of 100 eggs 16.4 × 11.8 mm (Baker). Building of nest by female alone, accompanied to and fro on her material-gathering trips by male. Old nests are frequently reoccupied. Incubation by female alone; she sits within with bill projecting from entrance-hole. Incubation period 14-15 days. Care of nestlings by both parents; young leave nest when 16 or 17 days old, after that male takes over most of feeding.

MUSEUM DIAGNOSIS. See Field Characters. Male does not moult into non-metallic winter (or eclipse) plumage. Postnuptial moult complete.

Young (♂ and ♀), like female but whole underparts very pale lemon-yellow. Distinguished from young of *N. asiatica* (1917) by rufous tinge to edges of secondaries and tertials. Young male assumes metallic plumage at postjuvinal moult, which is complete.

22

NECTARINIIDAE

1907. Indian Purplerumped Sunbird. *Nectarinia zeylonica sola* (Vieillot)

Cinnyris sola Vieillot, 1819, Nouv. Dict. d'Hist. Nat. 31: 512 (Pondichéry)

Nectarinia zeylonica whistleri Ripley, 1946, Spolia Zeylanica 24: 238 (Muddur, Mysore)

Baker, FBI No. 1287 (part), Vol. 3: 406

Plate 99, fig. 4

LOCAL NAMES. *Shākār khōrā* (Hindi); *Chūmka* (Marathi); *Man choongi* (Bengali); *Manja tinkili* (Malayalam).

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. Male. Above, crown metallic green. Back deep chestnut. Rump metallic purple. A metallic green shoulder-patch. Below, throat metallic purple. Sides of head and band across lower throat deep chestnut. Breast and centre of belly lemon-yellow. Flanks greyish white.

Female. Above, brown, more rufous on wing. Throat and flanks greyish white. Breast and centre of belly lemon-yellow.

STATUS, DISTRIBUTION and HABITAT. Common resident. Peninsular India south of a line from Nasik (NW. Maharashtra), Jabalpur (M.P.) and Lohardaga (Bihar), southern Bengal and Bangladesh north to Dacca and east presumably to the Chittagong region. In the plains and lower hills

Nectarinia zeylonica

21. ♂♀ Wing av. 56.2 mm; Tail av. 35.2 mm

Weight 8 ♂♂ 7-11; 9 ♀♀ 7-9 g — SA.

COLOURS OF RARE PARTS. Iris orange-brown or reddish brown. Bill brownish black; mouth dull orange-pink or pinkish brown. Legs, feet and claws horny brown or black; soles yellowish flesh.

1908. Ceylon Purplerumped Sunbird. *Nectarinia zeylonica zeylonica* (Linnaeus)

Certhia zeylonica Linnaeus, 1766, Syst. Nat., ed. 12, 1: 181 (Ceylon)

Baker, FBI No. 1287 (part), Vol. 3: 406

LOCAL NAMES. *Māl sūkkā* (Sinhala); *Thē-kūñ, Pū-kūñchān* (Tamil).

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. As in 1907, q.v.

STATUS, DISTRIBUTION and HABITAT. Common resident. Sri Lanka in all zones in the lowlands and lower hills up to c. 1400 m. Less common in the highlands, more abundant in the Wet zone. Affects open jungle, cultivation and gardens.

GENERAL HABITS. As in 1907.

FOOD. Nectar and small insects, soft caterpillars, spiders, etc.

VOICE AND CALLS. As they hop and flit about, both sexes constantly utter a chirp which though quite musical sounds like the opening and shutting of a large pair of scissors: *sweetly-snee, sweetly-snee*. At the same time the closed wings are flitted upwards and the tail opened and shut (Henry).

BREEDING. Season, February to June, many birds raising a second brood from August to November. Nests may be found throughout the year. Nest and eggs as in 1907. For details see Phillips, *Ceylon Jour. Sci.* 24, pt. 3: 11-14.

MUSEUM DIAGNOSIS. Differs from *sola* (1907) in being smaller. No significant colour difference although some Indian specimens have somewhat more extensive iridescence in the post-ocular area, tinted in some cases with bronze rather than green.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	50-57	17-18	14-16	30-35 mm
♀♀	50-54	16-18	15-16	29-32 mm

25

1909. *Small Sunbird*. *Nectarinia minima* (Sykes)*Cinnyris minima* Sykes, 1832, Proc. Zool. Soc. London: 99

(Chauts, Dukkun)

Baker, FBI No. 1286, Vol. 3: 405

Plate 99, fig. 7

LOCAL NAMES. *Chhotā shākār khārā* (Hindi); *Cheru tēnkili* (Malayalam).

SIZE. Sparrow —; length c. 8 cm (3 in.).

FIELD CHARACTERS. Male. Above, very similar to *N. zeylonica* (1907) but back deep crimson-brown or maroon instead of chestnut (difference not appreciable in the field), and without the metallic shoulder-patch. Below, also similar but collar broader, covering breast. Belly dull yellow with bright lemon tufts on sides. Flanks greyish white.

Female. Above, olive; lower rump deep crimson-brown. Below, dull yellow.

Small size and crimson-brown rump identify the female.

STATUS, DISTRIBUTION AND HABITAT. Fairly common resident. The Sahyadri or Western Ghats complex from Suriamal (north of Bombay) south

Nectarinia minima and *N. sperata*

Distributional ranges

1 *N. minima* (1909). 2 *N. s. brasiliana* (1910).

to the southernmost hills of Kerala, including the Bababudans, Biligirirangans, Nilgiris and Palnis¹, between c. 300 and 2100 m. In the Palnis occurs from c. 1600 m to the summits; in Karnataka replaces *N. lotenia*

¹ Unconfirmed reports from Sri Lanka appear to be erroneous (cf. Phillips, W. W. A., 1951, Ceylon Jour. Sci. Vol. 24, pt. 3: 13).

SUNBIRDS

27

FIELD CHARACTERS. Male. Above, crown metallic green. Upper back black. Rump and shoulder-patch metallic purple-blue. Tail and wings blackish. Below, throat metallic purple. Breast and upper belly deep maroon-crimson. Rest of underparts sooty brown.

Female. Above, olive; tail black. Below, yellow, brighter on belly.

STATUS, DISTRIBUTION AND HABITAT. Resident, apparently with some seasonal movements; locally distributed. Assam in Dibrugarh, Cachar (rare), Silchar, Hailakandi, Tripura and Manipur; Bangladesh in south Sylhet ('exceedingly plentiful from October to about mid January, rare thereafter' — Primrose, JBNHS 14: 594), Comilla and the Chittagong region. Affects forest and gardens and dense cover in swampy land.

Extratropical. Ranges east to southern Thailand and south to Sumatra and Borneo. The species extends east to the Philippines and Celebes (Sulawesi).

GENERAL HABITS. Typical of the sunbirds, cf. 1917.

FOOD. 'Feeds almost exclusively on nectar' (Hume).

VOICE AND CALLS. Call-note, a feeble *chip chip* uttered as it flies from flower to flower (Hume).

BREEDING. Records within our limits not beyond doubt (see Baker, Nidification 3: 219).

MUSEUM DIAGNOSIS. See Field Characters.

MEASUREMENTS	Wing	Bill (from skull)	Tarsus	Tail
♂ ♀	45-50	16-17	12-13	28-29 mm (Baker, MD)

SIZE. Sparrow —; length c. 13 cm (5 in.) including long bill.

FIELD CHARACTERS. A dark sunbird with long, slender, deeply arched bill.

Male. Above, whole head, back, shoulders and rump black with glistening metallic green and purple sheen. Wings and tail dull blackish. Below, throat

26

NECTARINIIDAE

above c. 1200 m. Affects evergreen biotope chiefly in foothills country: forest, sholas, gardens and shade trees in tea and coffee plantations.

GENERAL HABITS. Typical of sunbirds. Hunts actively among flower-clusters and leaf-buds, for insects and nectar, clinging upside down or sideways or hovering momentarily in front of them in the quest (SA). Partial to blossoms of *Erythrina* spp., and almost invariably present on clumps of the parasitic *Loranthaceae* in flower; also on a wide range of flowers in hill-station gardens. 'In Londa it did not frequent flowering *Butea* trees like *N. asiatica*' (Koels).

FOOD. Nectar, insects and spiders.

VOICE AND CALLS. Song, a squeaky *see-see-who-see-see-suree* etc. for five or ten seconds at a stretch and frequently repeated after short pauses; the bird pivots restlessly on its perch from side to side while singing (SA). Call-note a single metallic *chik* constantly repeated while foraging.

BREEDING. Season, chiefly December to April with a second and lesser peak (at least in the southern part of the range) in September and October. Nest, the usual hanging pouch characteristic of sunbirds, but smaller and neater in appearance and more roundish than those of other species; made largely of fine bast fibres and green moss with a little cobweb, and usually lacking the tail of rubbish dangling below. Suspended from the tip of a twig, generally under 2 metres up in a bush or sapling on the edge of a path or clearing, commonly on strobilanthes plants (*Karcia*). Eggs, 2, white with a dense ring of dark reddish spots and a few reddish speck elsewhere. Average size of 20 eggs 14 × 10.2 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters. In April or early May, male assumes an eclipse plumage which is similar to that of the female except that the metallic purple rump is retained (female has a crimson-brown rump). Moults to full metallic plumage takes place before August.

Young of both sexes alike and similar to the adult female, though rather yellower below. Young male acquires metallic plumage by complete moult, about May-June.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂ ♂	44-50	14-17	12-13	27-31 mm
♀ ♀	42-46	c. 15	c. 13	26-27 mm

(HW, SA, Koels)

Weight 8 ♂♂ (Apr.-May) 4-6; 8 ♀♀ (Apr.-May) 4-5 g—SA.

COLOURS OF BARE PARTS. Iris brown. Bill, legs, feet and claws in male blackish brown, in female somewhat paler.

(Brazilia error = Java)

Baker, FBI No. 1281, Vol. 3: 400

Plate 99, fig. 6

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 9 cm (3½ in.).

NECTARINIIDAE

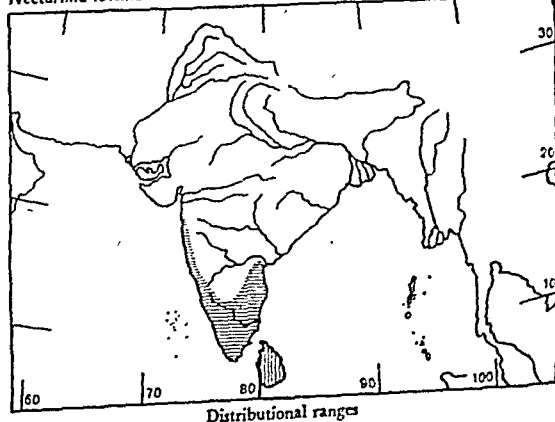

28

metallic green and purple changing to metallic purple on breast. A dark crimson or maroon band across breast and bright yellow tufts on sides of breast, at 'armpits'. Rest of underparts sooty brown.

Female. Above, dull olive. Tail blue-black with white tips. Below, entirely dull yellow.

The brilliant yellow feather-tufts at male's armpit are erected in sexual display to such an extent as to be strikingly conspicuous even on a rear view of the bird.

STATUS, DISTRIBUTION AND HABITAT. Fairly common resident in the southern Indian Peninsula, on the east side north to the Nallamalai Hills (c. 16°N.) and on the west side north to the Thana and Kolaba districts near Bombay (c. 20°N.). Occurs in the low country and hills up to c. 1600 (Kerala); in

Nectarinia lotenia

hindustanica (1911).

lotenia (1912).

Karnataka replaced by *N. minima* above c. 1200 m. Affects moist-deciduous biotope in well-wooded but fairly open country with plenty of flowering trees and shrubs, gardens and cultivation. Generally avoids dense evergreen forest but where it occurs it is confined to the canopy (Betts).

GENERAL HABITS. Keeps singly or in pairs flitting from flower to flower in quest of nectar. Parasitic loranthus clumps with their explosive ornithophilous flowers are particularly favoured. The bird springs the mature buds open by a pinch with the mandibles and probes the long tubular corollas with the specially adapted bill and extensible tubular tongue (common to the sunbird family). Usually alights on the flower-stalk or an adjacent branchlet for the purpose, but where large petals or otherwise unsuitable structure precludes feeding in the normal way, will take short-cut to the

SUNBIRDS

29

nectary through a hole pierced at the base of the calyx. Sometimes also hover momentarily above or in front of such flowers, like a hawk-moth, and shoot the suctorial tongue rapidly back and forth, well beyond the bill-tip, to reach the nectar.

Display. As in 1912.

FOOD. Nectar of many species of flowers, in particular *Loranthus*, *Lantana*, *Erythrina* and *Salmalia*. Also spiders and tiny insects.

VOICE AND CALLS. Call-note, a sharp, metallic *chit*, *chit*. Song *cheewit-cheewit-cheewit* quickly repeated two to six times from an exposed branch as the bird pivots from side to side and nervously raises and lowers his wings, erecting the bright yellow pectoral tufts (SA). See also 1912. The female has a soft sub-song.

BREEDING. *Season*, not well defined. Chiefly March to May but nests may be found in every month. *Nest*, a pear-shaped or oval pouch made of fine fibres, grass, moss, small leaves, roots and other material, lined with vegetable down or wool. The entrance is protected by a protruding porch. Nest distinguishable from that of other sunbirds by the comparative lack of cobweb in exterior construction; outside very untidy, covered with moss, dead leaves, caterpillar frass and oddments loosely attached and often hanging below the nest in a ragged tail. Suspended on a twig c. 3 metres or more above the ground, usually in the shady interior of some fairly dense-foliaged tree (Betts). Other nests however are wedged between twigs or creepers or built in a mass of spider webs and have been found in bushes as low as 50 cm above the ground. One has been observed close to the nest of red ants (*Oecophylla*), apparently in peaceful co-existence with the vicious insects. *Eggs*, 2, brownish white with dull brown spots at the small end, passing into large blotches and forming a cap at the large end. Average size of 50 eggs 17 × 12 mm (Baker). Building of nest by female accompanied by male flying back and forth and singing in the neighbourhood. Incubation by female only but male visits nest. Period 15 days. Both parents feed the nestlings; young out of nest fed mostly by male.

MUSEUM DIAGNOSIS. See Field Characters and Key to the Subspecies. Postnuptial moult from September to November, from metallic plumage to metallic plumage. No eclipse plumage.¹

Young, similar to female. Postjuvénal moult complete to adult plumage.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	56-60	27-29	15-16	36-40 mm
♀♀	53-56	26-28	14-16	32-35 mm

(HW, SA, Koelz)

Weight 8 ♂♂ 8-11; 7 ♀♀ 7-8 g-SA.

COLOURS OF BARE PARTS. Iris brown or reddish brown. Bill black; mouth pinkish brown. Legs and feet horny black.

¹ This, however, is equivocal. Some males observed (and filmed) by SA in February in plumage identical with that on *N. asiatica* (1917) in eclipse, namely more or less like female but with a broad black median band on underparts. See also Henry, 1955: 109 (footnote).

SUNBIRDS

31

1913. Andaman Olivebacked Sunbird. *Nectarinia jugularis andamanica* (Hume)

Arachnechthra andamanica Hume, 1873, Stray Feathers 1: 404

(Andaman group)

Baker, FBI No. 1285, Vol. 3: 404

LOCAL NAMES. None recorded.

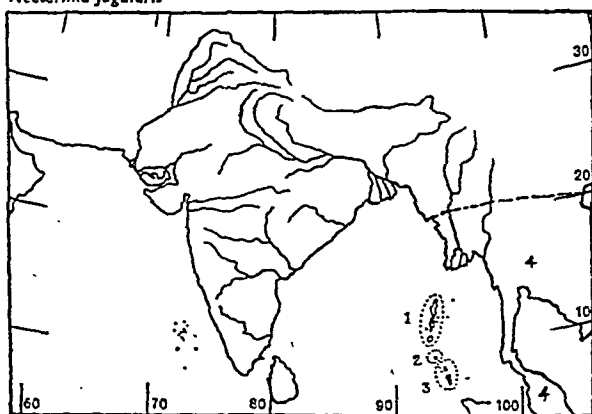

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. Male. Above, olive-brown. Tail black with whitish tips. Below, throat and breast metallic purple and blue-green bordered on breast with a rusty band. Pectoral tufts bright yellow; rest of underparts pale yellow. In eclipse plumage like female but with a dark gular stripe.

Female. Above, olive. Tail dark brown with whitish tips. Below, pale yellow, brighter on belly.

STATUS, DISTRIBUTION AND HABITAT. Common resident in the Andaman Islands. Affects forest, scrub and coastal mangroves.

Nectarinia jugularis

1 *andamanica* (1913), 2 *proselia* (1915), 3 *klossi* (1914), 4 extralimital subspecies.

Extralimital. Numerous subspecies in the Indochinese countries, Malaysia, Indonesia, the Philippines, New Guinea, the Solomon Islands and Queensland, Australia.

GENERAL HABITS. Those of the genus.

FOOD. Nectar [*Loranthus* spp., *Firmiana colorata*, *Moringa oleifera*, *Hibiscus* spp. and coconut (*Cocos nucifera*) specifically recorded]. Presumably also spiders and small insects.

30

NECTARINIIDAE

1912. Ceylon Maroonbreasted Sunbird. *Nectarinia lotenia lotenia* (Linnaeus)

Certhia Lotenia Linnaeus, 1766, Syst. Nat., ed. 12, 1: 188

(Ceylon)

Baker, FBI No. 1277 (part), Vol. 3: 394

LOCAL NAMES. *Ran sūikkā* (Sinhala); *Thēn-kūdi*, *Pē-kūdi-chān* (Tamil).

SIZE. Sparrow —; length c. 13 cm (5 in.) including long bill.

FIELD CHARACTERS. As in 1911, q.v.

STATUS, DISTRIBUTION AND HABITAT. Common resident. Sri Lanka in all zones, in the lowlands and hills up to c. 2100 m, more common below c. 1000 m. Affects open scrub, tea plantations and gardens.

GENERAL HABITS. As in 1911. Also hunts insects among the foliage and petals of flowering trees, and spiders for which it searches tree-trunks. 'Has a habit of continually jerking the head to and fro' (Henry).

Display. The male tightens all his feathers, looking strangely slim while his metallic colours gleam and scintillate. The bright yellow pectoral tufts — normally hidden under the closed wings — are puffed out, and the bird flies about in a series of deep loops singing all the while (Henry).

FOOD. Nectar, spiders and soft-bodied insects.

VOICE AND CALLS. Call-note *tuit* or *chit*. Song, a pleasing *titti-titu-weechi weechi weechi* (Henry).

BREEDING. *Season*, February to May in the low-country Dry zone, with a second period from August to December in the hills and in the Wet zone. *Nest*, of two types: (1) pear-shaped suspended from the tip of a twig, (2) built in the interior of a large mass of spider-webs usually in a bush or low tree. In the latter case (more common in the Dry zone) the female excavates a hole in the middle of the side of the cobweb mass, then presses out with her body a sufficiently large cavity and lines it first with a little fibre and bits of dead leaf to strengthen the walls and then with a generous amount of vegetable down. The entrance is neatly finished off with a small porch over it. The same nest may be used for several successive broods (Phillips). *Eggs* and breeding activity as in 1911.

MUSEUM DIAGNOSIS. Differs from *hindustanica* (1911) in being larger and having a longer bill.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	58-60	30-32	14-15	37-41 mm

NECTARINIIDAE

VOICE AND CALLS. Unrecorded.

BREEDING. *Season*, January-February and May to July. *Nest*, hung from some twig or grass stem, often close to the ground, less frequently at some considerable height up in a shrub or tree. The oval purse is made of grasses, bark, cocoons, moss, lichens, bits of leaves and vegetable fibres, and lined with fine grass and vegetable down; similar to that of *N. asiatica* but smaller and neater though many nests have miscellaneous rubbish hanging about and below them. *Eggs* 2, pale greyish white to pale brown, mottled over the whole surface with various shades of brown; markings very variable. Average size of 46 eggs 16.6 × 11.5 mm (Baker).

MUSEUM DIAGNOSIS. Male differs from both *klossi* and *proselia* in lacking (usually) any metallic colour on forecrown, and in having the upperparts brown only faintly tinged with olive. Metallic plumage on breast and sides of throat blue-green rather than purple-blue. Abdomen pale yellow (v. bright yellow), separated from metallic of breast by a narrow rusty band. Pectoral tufts bright yellow (v. orange-yellow) [MD].

Female differs in being browner, not olive above, and paler yellow below.

MEASUREMENTS

(Kondol Is., Nicobars)

Baker, FBI Nos. 1282 (part) and 1283, Vol. 3: 401-2

Plate 99, fig. 5

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. Male. Above, olive, usually with metallic purple forecrown. Below, throat metallic purple (centre), metallic purple-blue (sides and breast). Belly bright yellow. Pectoral tufts orange-yellow.

Female. Above, olive. Below, yellow.

STATUS, DISTRIBUTION AND HABITAT. Common resident in the Nicobar Islands, except Car Nicobar (where replaced by *proselia*). Affects forest, scrub and coastal mangroves.

Extralimital. See 1913.

GENERAL HABITS, FOOD AND VOICE. As in 1913, q.v.

BREEDING. As in 1913. Nest usually in mangroves, overhanging water.

MUSEUM DIAGNOSIS. Differs from *proselia* in being larger and having a longer bill. For differences from *andamanica* see 1913 (Museum Diagnosis). Rusty band between metallic breast and yellow belly only faintly indicated or absent.

Certhia asiatica Latham, 1790, Index Orn. 1: 288 (India = Gurgaon)

Baker, FBI No. 1278, Vol. 3: 396

Plate 99, fig. 10

LOCAL NAMES. *Kālā piddā* (Punjab); *Shākār khārā*, *Phūl soongni* (Urdu, Hindi); *Phūl chākli* (Gujarati); *Jugi-jugi* (Bhagalpur); *Suā* (Chota Nagpur); *Chūmka* (Marathi); *Karuppan tunkili* (Malayalam); *Thēna-pittā* (Telugu); *Thēn-kūdi*, *Pū-kūdičān* (Tamil); *Sūhikkā*, *Geval kūrilla* (Sinhala).

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. Male, breeding. Above, metallic dark blue and purple. Below, throat and breast metallic purple, sides blue-green. Belly dark purple separated from breast by a narrow, inconspicuous reddish brown band. Pectoral tufts bright yellow and scarlet. At a distance the bird appears all black.

Male, non-breeding (or eclipse plumage).

Above, pale olive-brown with blackish wings and tail. Below, yellow with a broad black band down middle of throat and breast.

N.B. Males in breeding as well as non-breeding plumage may be seen at almost any season.

Female. Above, olive-brown. Below, dull yellow. Distinguished from similar female Purplerumped (1907), often found alongside, by uniform yellow underparts (v. ashy throat contrasting with yellow breast).

STATUS, DISTRIBUTION and HABITAT. Common and widespread resident subject to local movements. The whole of India (east of the range of *brevirostris*) from the Himalayan foothills (Punjab to Sikkim) south to Kanyakumari, and Sri Lanka in all zones. Intergrades with *intermedia* in Bengal. A summer visitor to Punjab (March to September) and the Himalayan foothills (up to c. 1200 m in Kangra, 1400 m in Nepal, locally to 1700 m). In the hills of southern India generally up to c. 900 m, in the Madurai district to c. 1600 m, in the Nilgiris to 2400 m (Nichols, JBNHS 44: 406). In Sri Lanka occurs at all altitudes in winter but the majority breed in the lowland dry zone, leaving the hills early in December and returning in July (Phillips). Affects light deciduous forest, semi-cultivation, gardens and compounds.

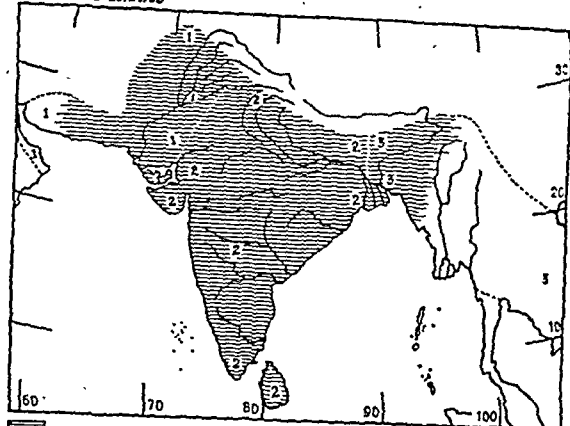

Local movements. A male ringed at Bharatpur, 5.iii.1968, was recovered three years later, on 30.iii.1971, at Dehra Dun, c. 350 km north — presumably moving up to its annual summer quarters.

GENERAL HABITS. Very similar to those of Purplerumped and Maroon-breasted sunbirds (1907, 1911), q.v. Keeps singly or in pairs. Inseparable from flowering trees and lorchanthus clumps in gardens, orchards and the countryside. Probes into blossoms of a wide variety of trees and shrubs with the specially adapted nectar-eating bill and tongue and plays an important role in cross-pollinating many species. Along with other sunbirds it is amongst the chief pollinators of the 'explosive' lorchanthus flowers. Individual birds not uncommonly seen hawking goats in the flycatcher manner, but an

FIELD CHARACTERS. As in 1917, q.v.

STATUS, DISTRIBUTION and HABITAT. Partial migrant, common. Baluchistan in coastal and central Makran, Quetta district, N.W.F.P. north to Peshawar, the northern foothills east to the Sutlej river, the plains of the

Nectarinia asiatica

Distributional ranges 1 *brevirostris* (1916), 2 *asiatica* (1917), 3 *intermedia* (1918).

Indus south through Sind, western Gujarat (Kutch) and western Rajasthan; intergrades with nominate race (1917) east of these limits. In the hills generally up to c. 1200 m, locally 1500 m. Affects gardens, cultivation, tamarisks along river beds, thorn and dry forest.

Extralimital. Extends west to southern Iran and southeastern Arabia (Muscat). The species ranges east through the Indochinese countries.

MIGRATION. A summer visitor to the northern foothills and most of Punjab plains; arrives March or April according to altitude, departs end August or early September (latest 17 Sept.). A few birds winter in the plains of Punjab. In Sind, partly a summer visitor partly resident, the winter population increased by migrants from the north. May winter in western India as far south as Londa (cf. Koelz, JBNHS 43: 22).

GENERAL HABITS, FOOD and VOICE. As in 1917.

BREEDING. Season, end March to July. Nest and eggs as in 1917. Clutch size 2 or 3. Average size of 30 eggs 16.7 x 11.6 mm (Baker).

MUSEUM DIAGNOSIS. Like *asiatica* (1917) but bill shorter. Above rather more green. Reddish brown pectoral band often absent. Female like *asiatica* but paler. Bill shorter.

MEASUREMENTS

	Wing	Tarsus	Tail
♂ ♀	55-57	15-16	34-35 mm (Baker)

NECTARINIIDAE

36

unusual gathering of 40 or 50 once observed energetically catching midges swarming over a stagnant stream. Several birds at a time would spring up in the air from the bordering shrubbery and snap up the minute insects; or they would launch out horizontally for a distance of 15 metres or so over the water and hover and zigzag and twist and turn in agile pursuit returning to the perch after each capture, evincing extraordinary acuity of vision (SA).

Display. The male, with slightly raised head and perched in front of the female, flutters his partially opened wings to display the pectoral tufts, singing the while. For further details see A. R. K. Das, *Pavo* 2: 72, 1964. Also displays by hovering vertically in the air, his wings beating so rapidly as to show only as a blur, while the pectoral plumes stand out in front of them like a blaze. For a few seconds this attitude is maintained, then with a flick of his wings he is away, only to return in a few moments and repeat the performance (Baker).

FOOD. Nectar of lorchanthus and many other flowers. For a list of some of the more commonly patronized species see Salim Ali, 1931 and 1932. Very fond of the fleshy blossoms of *mhowa* (*Madhuca indica*) and the sugary exudation from *Borassus* palms tapped for toddy. Small spiders and insects are also taken, especially when rearing young. Among the insect items specifically recorded in stomach contents are Tineid and Geometrid larvae, weevils (*Myloecerus* sp.), bugs (*Cydnius nigrifrons*), Jassids and small flies (Mason & Lefroy, 1912). For notes on feeding habits, see A. R. K. Das, 1963, *Pavo* 1: 60-65.

VOICE and CALLS. Call-notes, a single chip and a frequently uttered, loud *chevret* (Henry). Song, usually given by male from the topmost twig of a leafless tree or a telegraph wire, an excited *chevret-chevret* ... repeated rapidly two to six times while the bird pivots from side to side and nervously raises and lowers his wings, flaunting the brilliant crimson and yellow pectoral tufts erected laterally. Approaches singing perch with a curious hovering flight with tail well expanded (SA). Male in non-breeding plumage often utters a low twittering sub-song which goes on for a long time without any appreciable pause 'invariably in the afternoon hours' (Neelakantan). Song may be heard the year round. Main period in Nepal February to early June and September-October (Proud).

BREEDING. Season, varies according to climate and altitude, chiefly in the dry season though nesting has been reported in nearly every month. In Nepal Valley breeds chiefly in June; in Haryana from March to June; in most parts of the Peninsula from February to June, starting even earlier in the south. Two broods are commonly raised. In Sri Lanka breeds from January to June, occasionally till September, with a peak in March-April. Nest, an oblong purse of soft grass and fibres, small leaves, bark, cobweb, etc., untidily draped on the outside with pieces of bark, caterpillar droppings, bits of paper, string and other rubbish; most nests have a porch-like projection over the entrance. Usually suspended on a twig within a couple of metres from the ground; occasionally up to six metres. Some nests are hung from the trellis-work of verandas, or creepers growing over them, or from the fleshy thorny leaves of prickly pear (*Opuntia*) bushes; one was found hanging from a bush growing in a disused well about a metre and a half below ground level. Despite the usual lack of concealment, the nest

SUNBIRDS

37

often escapes notice as it may easily pass for a casual wind-blown collection of cobwebs and rubbish. Nests frequently found within the greyish flocculent nest masses of the gregarious Eresid spider *Stegodyphus sarasinorum*, and perhaps other species, in thorny trees and hedges. The nest is completely enveloped by the adhesive cobweb fabric except for the entrance-hole, thus enjoying additional cryptic value and concealment. Examination of such nests has failed to reveal conclusively whether the bird chooses the cobweb mass for building within, or whether the spider builds over an old nest which the bird uses again for the second brood as seems more probable (see *Bombay Newsletter for Birdwatchers*, June 1963, p. 2 and August 1963, p. 7). Some unusual sites recorded: Punkah-pulling rope (Gill, JBNHS 29: 967), hanging electric wire of portico lamp in regular use (Shipp, *ibid.* 28: 1136), rafter in veranda (Bates, *ibid.* 31: 282), pendent flush-tank chain in temporarily disused lavatory (Joseph George, *ibid.* 54: 943), pocket of nightgown and fold in canvas drying on a clothes line (Munidas, *ibid.* 66: 169-71, and *Ceylon Bird Club Notes*, May 1968). For details on building method see Joseph George, JBNHS 55: 420-28. Eggs, normally 2, sometimes 1 or 3, greyish white with chocolate streaks tending to form a band around the large end. Average size of 100 eggs 16.3×11.6 mm (Baker). Female alone collects materials and builds nest, sometimes accompanied to and fro by male; exceptionally male may also help; building may take from six days to three weeks. Incubation, starting with first egg, by female alone; period 14 or 15 days. Nestling period 13 to 17 days. Feeding of nestlings and sanitation by both parents though in some cases the latter chore apparently done by female only. Two successive broods often reared in the same nest. For further details on breeding biology see Das (1964, 1966). Brood-parasitism by Plaintive Cuckoo, *Cacomantis m. passerinus* (584) recorded — M. Suter, 1945, JBNHS 45(2): 235.

MUSEUM DIAGNOSIS. See Field Characters and Key to the Subspecies. Prenuptial moult November to February. Postnuptial moult complete, mostly July to December.

Young, like female. Postjuvénal moult complete or wing not moulted till prenuptial moult.

MEASUREMENTS

NECTARINIIDAE

and Bengal (Jalpaiguri dist.) reaches the base of the hills in the cold season. Affects deciduous forest, especially oak, and the lower coniferous zone.

Extralimital. Extends east to southwestern Szechuan. The species ranges east to Hupeh, Kwangsi and the Indochinese countries.

GENERAL HABITS. Similar to other sunbirds'. A very active and vivacious species, restlessly searching blossoms for nectar on bushes and shrubs as well as among parasitic plants up in lofty forest trees.

FOOD. Nectar, insects, spiders.

VOICE AND CALLS. Common notes rendered as a scissors-like *tzit-tzit*.

BREEDING. As in 1920.

MUSEUM DIAGNOSIS. Differs from *isolata* (1920) in being darker yellow on breast and rump. For identification of females see Key to the Species.

Juvenile, like female but tail not so graduated nor tips so whitish (CBT).

Postjuvénal moult complete. Adult plumage held till post-breeding moult; no eclipse plumage.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail

LOCAL NAMES. None recorded.

SIZE. Sparrow — ; length ♀ c. 10 cm (4 in.); ♂ c. 15 cm (6 in.) including long tail.

FIELD CHARACTERS. As in 1919, q.v.

STATUS, DISTRIBUTION AND HABITAT. Uncommon resident, subject to seasonal movements. Assam south of the Brahmaputra, Nagaland, Manipur and the hills south to the Chittagong Hill Tracts, chiefly between 900 and 2400 m. Affects evergreen forest and deciduous scrub jungle.

GENERAL HABITS, FOOD AND VOICE. As in 1919.

BREEDING. Season, April through June. Nest, a pear-shaped structure of vegetable down, green moss and cobweb, suspended from the end of a twig rather low down on bushes or brambles. The edge of the entrance,

which is about two-thirds of the way up, is reinforced so as to form a firm rim. Eggs, generally 2, sometimes 3, white freckled with small blotches of pale reddish brown, slightly more numerous at the larger end. Average size of 10 eggs 14.6 × 11.2 mm (Baker). Building of nest and care of young by both sexes.

MUSEUM DIAGNOSIS. Differs from *gouldiae* (1919) in being a paler yellow on rump and breast, and in being slightly smaller. Female indistinguishable in colour.

Baker, FBI No. 1271, Vol. 3: 387

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length ♀ c. 10 cm (4 in.); ♂ 15 cm (6 in.) including long tail.

FIELD CHARACTERS. As in 1919 but breast scarlet instead of yellow.

STATUS, DISTRIBUTION and HABITAT. Presumably a winter visitor from western China. Recorded in extreme eastern Nagaland (Ripley, 1953, JBNHS 61: 693), in Manipur (sight record, Hume, SF 11: 81), and in North Cachar (Baker, FBI 3: 388) between 1200 and 1800 m.

MIGRATION. In adjacent Burma this form has been recorded from January to March.

GENERAL HABITS, FOOD and VOICE. As in 1919.

BREEDING. Extralimital.

MUSEUM DIAGNOSIS. Differs from both *gouldiae* (1919) and *isolata* (1920) in having a scarlet breast. Metallic colour of crown and throat more lilac or purple than blue.

MEASUREMENTS

	Wing	Tail
7 ♂♂	53-59	75-76 mm (Mayr)

COLOURS OF BARE PARTS. As in 1920.

1923. Nepal Yellowbacked Sunbird. *Aethopyga nipalensis nipalensis* (Hodgson)

Cinnyris Nipalensis Hodgson, 1836, Ind. Rev. 1 (7): 273

(Nepal, restricted to Chandragiri Pass, central Nepal, by Ripley, 1961, Synopsis: 588)

Aethopyga griseiceps Benthams, 1908, Rec. Ind. Mus. 2: 167 (Darjiling)

Baker, FBI No. 1274 (part), Vol. 3: 391

Plate 99, fig. 11

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length ♀ c. 10 cm (4 in.); ♂ c. 15 cm (6 in.) including long tail.

FIELD CHARACTERS. Male, adult. Above, crown and nape metallic blue-green, bordered on upper back and sides of neck by a crimson-brown or maroon band. Wings and middle of back olive-green. Rump bright yellow; tail metallic blue-green. Below, cheeks black, throat metallic blue-green. Rest of underparts bright yellow streaked with scarlet on breast.

Female olive-green, outer rectrices tipped with white.

STATUS, DISTRIBUTION and HABITAT. Common resident, subject to vertical movements. The central Himalayas from western Nepal to Darjeeling and Sikkim. Breeds between c. 1800 and 2700 m [not breeding above this altitude in central Nepal (Proud) but has been recorded as high as 3500 m in the Langtang Valley (Polunin)]. Recorded in winter between 300 and 2400 m in Nepal and as high as 3600 m in Sikkim. Affects heavy forest of oak, rhododendron, etc. (more so than *A. ignicauda*) and scrub jungle.

GENERAL HABITS. Those of the genus. In Nepal the four species *nipalensis*, *ignicauda*, *saturata* and *siparaja* may all be found together in winter, feeding on flowering *Leucosceptum*, *Caryopteris* and suchlike species 'but Gould's Sunbird is never found with them' (Proud).

FOOD. Mainly nectar.

VOICE and CALLS. Call-note, a sharp *dzit*. Song described as *ichiss* (high) ... *ichiss-iss-iss-iss* (low-rising-high) [Lister]. Song period in Nepal February to mid June (Proud).

BREEDING. Season, chiefly May and June. Nest, an oval purse of vegetable down and green moss suspended from the end of a twig within a couple of metres from the ground. Entrance near the top, about 25 mm in diameter. Eggs 3, white, spotless or sparingly spotted and mottled with dark brown. Average size of 3 eggs 15.7 × 10.9 mm (Osmaston); of 11 eggs 15.3 × 10.8 mm (Baker).

MUSEUM DIAGNOSIS. Differs from *horsfieldi* in having a broader maroon band on upper back, and from *koelzi* in having a shorter bill.

Young, like adult female but tail not so markedly graduated and the pale tips not so pronounced. Young male has an orange wash on breast. Postjuvinal moult complete in October to January. No eclipse plumage (CBT).

For identification of female see Key to the Species.

MEASUREMENTS	Wing	Bill (from skull)	Tarsus	Tail
♂♂	51-58	{ 20-23 } 20-22	c. 15	{ 58-70 mm 42-49 mm (BB)
♀♀	47-52			

Weight 2 ♂♂ 6.5, 8; 4 ♀♀ 5-6 g (GD, SA).

1922. Western Yellowbacked Sunbird. *Aethopyga nipalensis horsfieldi* (Blyth)

Nepal (where it intergrades with *nipalensis*), between 600 and at least 1800 m. Affects gardens and forest.

GENERAL HABITS, FOOD and VOICE. As in 1923.

BREEDING. Unrecorded, probably as in 1923.

MUSEUM DIAGNOSIS. Male, like *nipalensis* (1923) but back and sides of neck olive-yellow with only a trace of maroon along the margin of the metallic green of hindneck; hardly any trace of scarlet on breast.

MEASUREMENTS. As in 1923 but bill averaging 1 or 2 mm shorter.

COLOURS OF BARE PARTS. As in 1923.

COLOURS OF BARE PARTS. Iris reddish brown. Bill, legs and feet dark brown. Soles grey.

1924. Eastern Yellowbacked Sunbird. *Aethopyga nipalensis koelzi* Ripley

Aethopyga nipalensis koelzi Ripley, 1948, Proc. Biol. Soc. Washington 61: 106 (Dening-Dreyi trail, Mishmi Hills, NE. Asam)

Baker, FBI No. 1274 (part), Vol. 3: 391

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length ♀ c. 10 cm (4 in.); ♂ c. 15 cm (6 in.) including long tail.

FIELD CHARACTERS. As in 1923, q.v.

STATUS, DISTRIBUTION and HABITAT. Common resident, subject to vertical movements. Bhutan, Arunachal Pradesh, Meghalaya, Nagaland and Manipur south to the Chittagong Hill Tracts. In the Himalayas breeds between c. 1800 and 2800 m, rarely reaching the duars in winter. Affects dense forest, scrub jungle and gardens.

Extralimital. Extends to northwestern Yunnan and northern Vietnam. Other subspecies in the Indochinese countries.

GENERAL HABITS, FOOD and VOICE. As in 1923.

BREEDING. As in 1923.

MUSEUM DIAGNOSIS. Differs from *nipalensis* (1923) only in having a longer bill.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail

Weight ♂♂ 5.5-7.5 g (SDR); 4 ♀♀ 6.6-5.5 g (SA).
COLOURS OF BARE PARTS. As in 1923.

AETHOPYGA SATURATA (Hodgson)

Key to the Subspecies

Less richly coloured.....	<i>A. s. saturata</i>
More richly coloured.....	<i>A. s. assamensis</i>

1925. Himalayan Blackbreasted Sunbird. *Aethopyga saturata saturata* (Hodgson)

Cinnyris Saturata Hodgson, 1836, Ind. Rev. 1 (7): 273 (Nepal)

Baker, FBI No. 1272 (part), Vol. 3: 388
Plate 99, fig. 12

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length ♀ c. 10 cm (4 in.); ♂ c. 15 cm (6 in.) including elongated rectrices.

FIELD CHARACTERS. Male, adult. Above, crown and nape metallic purple. Back and sides of neck crimson-brown. Wings blackish brown.

SUNBIRDS

45

A narrow yellow band on rump. Upper tail-coverts and upper surface of tail metallic purple, the two central rectrices elongated. *Below*, throat and breast dull blackish, a broad metallic purple malar streak. Rest of underparts greyish olive.

Female, a nondescript olive-green. See Key to the Species.

STATUS, DISTRIBUTION AND HABITAT. Fairly common resident, subject to vertical movements. The Himalayas from Mussoorie east to Bhutan, from c. 450 m in winter (in Bengal and Bhutan to the base of the hills and adjacent duars) up to c. 1800 m in summer (in Bhutan up to 2000 m).

Aethopyga saturata

Distributional ranges 1 *saturata* (1925), 2 *assamensis* (1926), 3 extralimital subspecies.

Withdraws from the higher levels 'for a couple of months in the coldest weather but is back and singing by the end of February' (Proud). Affects bushes in forest and outskirts of dense jungle, chiefly in the evergreen zone.

GENERAL HABITS. Those of the genus. Recorded visiting cherry blossoms in season; also cardamom flowers at ground level. Along with other sunbird species is an unfailing attendant on the scarlet 'cup and saucer' flowers of *Holmskjoldia*.

FOOD. Chiefly nectar.

VOICE AND CALLS. Undescribed. Song period in Nepal February to mid July (Proud).

BREEDING. As in 1926.

MUSEUM DIAGNOSIS. Differs from *assamensis* in being less richly coloured.

Young, like adult female but tail not so graduated and white tips not so distinct. Postjuvénal moult complete. No eclipse plumage (CBT). For identification of female see Key to the Species.

SUNBIRDS

47

COLOURS OF BARE PARTS. Iris brown. Bill black. Legs and feet dark brown.

1927. **Indian Yellowbacked Sunbird.** *Aethopyga siparaja scheriae* (Tickell)

Nectarinia scheriae Tickell, 1833, Jour. Asiat. Soc. Bengal 2: 577 (near Scheria in Borabhum)

Aethopyga siparaja mussoorieensis Baker, 1925, Bull. Brit. Orn. Cl. 46: 12 (Mussoorie)

Baker, FBI Nos. 1262 (part) and 1263, Vol. 3: 378, 380

Plate 99, fig. 13

LOCAL NAME. *Phulchūiya* (Dehra Dun).

SIZE. Sparrow —; length ♀ c. 10 cm (4 in.), ♂ c. 15 cm (6 in.) including elongated rectrices.

FIELD CHARACTERS. Male, adult. *Above*, crown metallic green. Sides of neck and back dark crimson. Rump bright yellow. Tail metallic green, the two central rectrices elongated. *Below*, chin, throat and breast scarlet with metallic purple malar streaks. Belly yellowish olive.

Female entirely olive, more yellowish below.

STATUS, DISTRIBUTION AND HABITAT. Common resident, subject to vertical movements. The Himalayan foothills from Kangra east to Sikkim thence south in the plains of eastern Bihar (Purnea), northern Bengal (Ingles, JBNHS 26: 996) and western Bangladesh (Rashid). Also occurs in the hills of the northeastern Peninsula but the few records are old and mostly undated: Allahabad, Mirzapur (U.P., Hume, SF 5: 122), Singhbhum (Ball, SF 7: 208), Scheria in Borabhum (type locality), Lohardaga (Ball, SF 2: 396), Bamra (Orissa, specimens 8 December — SA) and Balaghat (Madhya Pradesh, 1 April, D'Abreu, JBNHS 22: 393). In the Himalayas occurs up to c. 1200 m (Dharmasala, at this level from March to August only), in Nepal up to c. 1800 m in summer, 1400 m in winter. Affects gardens, orchards, groves, scrub, sal and pine forest.

GENERAL HABITS. Those of the genus. Usually found singly, foraging among loranthus clusters, blossoms of a wide range of trees and shrubs, and garden flowers, hopping about energetically, clinging sideways, upside down and in all manner of acrobatic positions among the branchlets and dashing from tree to tree. Large flowers (e.g. hibiscus and canna) are pierced at the base of the corolla for short-cut to the nectar. Often hovers in front of flowers like a hawk-moth to insert the suctorial tubular tongue

Baker, FBI No. 1272 (part), Vol. 3: 388

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length ♀ c. 10 cm (4 in.), ♂ c. 15 cm (6 in.) including elongated rectrices.

FIELD CHARACTERS. As in 1925, q.v.

STATUS, DISTRIBUTION AND HABITAT. Resident, subject to vertical movements. Arunachal Pradesh, Assam south of the Brahmaputra, Meghalaya and adjacent hills of Bangladesh, the Patkai Range, Nagaland and Manipur; from the foothills to c. 1800 m. In North Lakhimpur district 'a resident throughout the plains' (Stevens). Affects dense evergreen and deciduous forest, scrub, secondary growth and open pasture land with scattered bushes.

Extralimital. Northern Burma to western Yunnan. Other subspecies in the Indochinese countries.

GENERAL HABITS, FOOD AND VOICE. As in 1925.

BREEDING. Season, May to July. *Nest*, pear-shaped, made of dry grass, moss, fibre and cobweb, decorated outside with chips of dead wood and bamboo leaves, lined with vegetable down; entrance-hole two-thirds of the way up, with a porch projecting 2 or 3 cm over it, sometimes with only a bare suggestion of a porch; nest usually attached to thin branches of bushes or creepers within a couple of metres from the ground. *Eggs*, 2 or 3, white, marked with specks and spots and occasionally blotches of inky black with secondary ones of inky grey. Average size of 25 eggs 14.6 × 11.3 mm (Baker).

MUSEUM DIAGNOSIS. Differs from *saturata* (1925) in being more richly coloured.

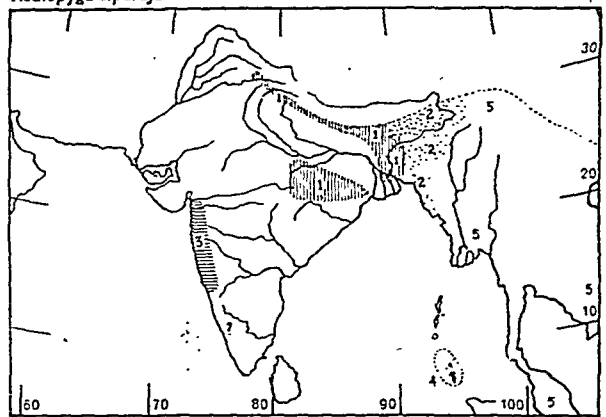

MEASUREMENTS

for the sugary liquid. A predilection for bright crimson and scarlet coloured flowers has been consistently noted.

FOOD. Chiefly nectar; also insects and spiders.

VOICE AND CALLS. 'Call very like the noise of scissor blades opening and shutting' ('S.R.' in Whistler MS.). Song described as a chirping trill.

BREEDING. As in 1928. Brood-parasitized by Emerald Cuckoo (*Chalcites maculatus*, 586) — Baker, JBNHS 18: 278.

MUSEUM DIAGNOSIS. See Key to the Subspecies. For details of plumage, see Baker, loc. cit.

Young male, like female but chin and centre of throat scarlet. Young female, like adult female but greyer, not so yellow below. Postjuvénal moult complete. A complete postnuptial moult about November–December (Rand & Fleming). Some body moult noted in March (BB). No eclipse plumage (CBT).

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail

♀♀	47-53	19-21		
				(BB, SA, Stres.)

Weight 1 ♂ (Nov.) 7.5 g (BB). 4 ♂♂ (March) 6.4-7.9 g (GD).

COLOURS OF BARE PARTS. Iris dark brown. Bill: upper mandible dark brown, black on basal third; lower mandible horny brown. Legs, feet and claws dark brown.

SUNBIRDS

49

1928. **Assam Yellowbacked Sunbird.** *Aethopyga siparaja labecula* (Horsfield)
Cinnyris labecula Horsfield, 1839 (1840), Proc. Zool. Soc. London: 167 (Assam)
Baker, FBI No. 1262 (part), Vol. 3: 378

LOCAL NAMES. None recorded.

SIZE. Sparrow — ; length ♀ c. 10 cm (4 in.), ♂ c. 15 cm (6 in.) including elongated rectrices.

FIELD CHARACTERS. As in 1927, q.v.

STATUS, DISTRIBUTION AND HABITAT. Common resident, subject to vertical movements. The eastern Himalayas in Bhutan and Arunachal Pradesh and south through Assam, Meghalaya, Nagaland, Manipur and Bangladesh (east of the range of *seheriae*) south to the Chittagong region. Breeds from the foothills up to c. 1800 m. More common in winter in the foothills and adjacent plains. Affects dense evergreen forest and open deciduous and scrub jungle.

Extralimital. The species extends east to Kwangtung, the Indochinese countries and the Philippines, and south to Celebes, Borneo, Sumatra and Java.

GENERAL HABITS, FOOD and VOICE. As in 1927.

BREEDING. Season, April to July. Nest, pear-shaped, generally with a porch over the entrance; made of vegetable down, rootlets, moss and scraps of grass and cobweb, more or less decorated on the outside with oddments. Eggs, 2 or 3, white or cream, marked with brown or reddish brown specks, especially at the large end; very variable; for further details see Baker, Nidification 3: 203. Average size of 31 eggs 15.1 × 11.4 mm.

MUSEUM DIAGNOSIS. Differs from *seheriae* in both sexes being darker and more richly coloured above and below.

MEASUREMENTS and COLOURS OF BARE PARTS. As in 1927. Tail of 1 ♂ 81 mm (SA). Weight ♂♂ 6.9; 1 ♀ 6 g (SDR).

1929. **Vigors's Yellowbacked Sunbird.** *Aethopyga siparaja vigorsii* (Sykes)
Cinnyris Vigorsii Sykes, 1832, Proc. Zool. Soc. London: 98 (Ghauts, Dikhun)
Baker, FBI No. 1265, Vol. 3: 381

LOCAL NAME. *Tenkili* (Malayalam).

SIZE. Sparrow — ; length ♀ c. 10 cm (4 in.), ♂ c. 15 cm (6 in.) including elongated rectrices.

FIELD CHARACTERS. As in 1927 but breast of male streaked with yellow.

STATUS, DISTRIBUTION AND HABITAT. Common resident. The Western Ghats complex from the Narbada river (Salim Ali, JBNHS 52: 788) south to North Kanara. Possibly farther south to Kerala, though not yet authentically recorded thence, and also the Nilgiris [Whistler's MS., based on sight records 'near Ootacamund and lower down along the road, about 900 m elevation, before reaching Gudalur', first week of September (J. Berlioz in litt. to HW; cf. also *L'Oiseau*, 1940, 10: 315)]. Affects wooded, preferably foothills country in evergreen and moist-deciduous biotope.

SUNBIRDS

51

SIZE. Sparrow — ; length ♀ c. 10 cm (4 in.), ♂ c. 15 cm (6 in.) including elongated rectrices.

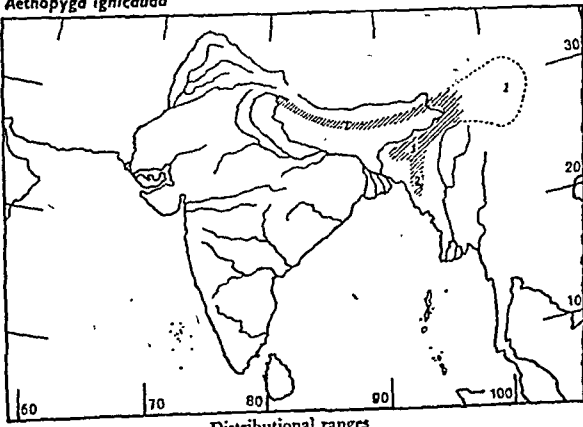

FIELD CHARACTERS. Male, adult. Above, crown metallic purple. Sides of crown from eye, nape, back, upper tail-coverts and tail scarlet. Rump yellow. Wings olive. Throat metallic purple. Rest of underparts yellow, the breast washed with orange.

Identity unmistakable from the elongated central pair of bright crimson tail-feathers.

Female olive, more yellow on rump and belly.

STATUS, DISTRIBUTION AND HABITAT. Common resident, subject to vertical movements. The Himalayas from Garhwal east through Arunachal Pradesh; thence south through Nagaland, Manipur, Assam in the Cachar hills, Meghalaya, and Bangladesh in Sylhet and Chittagong Hill Tracts (winter

Aethopyga ignicauda

Distributional ranges

1. *ignicauda* (1930), 2. *flavescens* (RE, Chin Hills). only?). Breeds between c. 3000 and 4000 m, at higher elevations than *A. nipalensis*; winters between c. 1200 and 2900 m. Affects open coniferous forest with dense growth of rhododendron and juniper, rhododendron and barberry bushes at or above timber-line.

Extralimital. Extends to western Szechuan and central Yunnan. Another subspecies in the Chin Hills.

GENERAL HABITS. Those of the genus. Very active while visiting flowering bushes for nectar, and aggressive towards food competitors.

FOOD. Chiefly nectar (of *Rhododendron arborum*, *R. campanulatum*, *Berberis*, *Elaeagnus*, *Leucosceptum*, etc.); also insects and spiders.

VOICE and CALLS. Song, a high-pitched, monotonous *dzidzi-dzidzidzidzi* continually repeated as the birds fly from bush to bush, pursuing each other (Desfaves). Song period in Nepal April to at least the end of June (Proud).

NECTARINIIDAE

50

GENERAL HABITS, FOOD and VOICE. As in 1927. Call a sharp, harsh but lively *chi-chwee* reminiscent of the Blacknaped Monarch Flycatcher's (*Monarcha azurea*, 1465).

BREEDING. Season, June to September (monsoon). Nest and eggs, as in 1928. Nests commonly suspended from bushes growing out of and overhanging steep roadside earth cuttings in hilly country.

MUSEUM DIAGNOSIS. Differs from *seheriae* in having the scarlet of breast streaked with yellow. For details of plumage see Baker, loc. cit. Some females have the chin, throat and breast dull orange-scarlet (SA, JBNHS 52: 788).

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	61-65	23-27	15-16	50-58 mm
♀♀	54-57	21-24		35-38 mm (SA)

Weight 2 ♂♂ 7, 9; 2 ♀♀ 7, 8 g (SA).

COLOURS OF BARE PARTS. Iris red-brown to crimson. Bill blackish, dark brown below. Legs and feet dark brown to blackish.

1929a. **Nicobar Yellowbacked Sunbird.** *Aethopyga siparaja nicobarica* Hume
Aethopyga nicobarica Hume, 1873, Stray Feathers 1: 412 (Kondul and Meroe Islands, Nicobar Group)
Baker, FBI No. 1261, Vol. 3: 377

LOCAL NAMES. None recorded.

SIZE. Sparrow — ; length ♀ c. 10 cm (4 in.), ♂ c. 15 cm (6 in.) including elongated rectrices.

FIELD CHARACTERS. As in 1927, q.v.

STATUS, DISTRIBUTION AND HABITAT. Common resident. Great and Little Nicobar, Kondal and Meroe islands. Affects open country, outskirts of forest and coconut groves.

GENERAL HABITS, FOOD and VOICE. As in 1927.

BREEDING. Little recorded. Probably as in 1928.

MUSEUM DIAGNOSIS. Differs from *labecula* in having the crown and tail violet-purple.

MEASUREMENTS

	Wing	Tail
♂♂	50-52	40-45 mm
♀♀	—	32-33 mm (MD)

COLOURS OF BARE PARTS. As in 1927.

(Cinnyris) Ignicauda Hodgson, 1836, Ind. Rev. 1 (7): 273 (Nepal)
Baker, FBI No. 1266, Vol. 3: 383 Plate 99, fig. 16

LOCAL NAMES. None recorded.

NECTARINIIDAE

52

BREEDING. Season, April to June. Nest, an oval structure with a small entrance near the top; made of moss, rootlets, cobweb, papery bark, lined with vegetable down, fine grass and feathers; suspended from a branchlet of dwarf bamboo or other bush within a couple of metres from the ground. Eggs, 2 or 3, variable: pale violet-white covered with purplish speckles or brick-red with darker brick-red freckles (Himalayas), or white with tiny brown blotches forming a broad ring at the large end (Assam). Average size of 12 eggs 15.6 × 11.8 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters and Key to the Species. Postnuptial moult to eclipse plumage complete, October to February; male becomes green like female but has the underparts brighter yellow, often showing some odd orange or reddish tinted feathers. Upper tail-coverts red. Tail longer than in female, outer webs red; central rectrices not projecting more than c. 15 mm beyond rest of tail; central rectrices apparently moulted last, an exceptional condition among passerine birds (cf. Stanford, J. K. & Mayr, E., *Ibis* 1941: 480). Prenuptial moult to breeding plumage from February to April; in this the central or all rectrices are renewed and the body plumage moulted, but apparently not the wings. Males in breeding plumage may be found in every month (C. B. Ticehurst, *Ibis* 1935: 197).

Young male, similar to female but has a patch of reddish feathers between throat and breast.

MEASUREMENTS	Wing	Bill (from skull)	Tarsus	Tail
♂♂	55-60	21-24	c. 16	(summer) 109-157 mm
♀♀	52-56	21-22		(eclipse) c. 48 mm
				c. 40 mm (BB, SA, Stres., Rand & Fleming)

Weight 2 ♂♂ (winter) 7.5, 9 g (SDR).

COLOURS OF BARE PARTS. Iris dark brown. Bill, legs and feet blackish brown.

Genus ARACHNOTHERA Temminck

Arachnothera Temminck, 1826, Pl. Col. d'Ois. 65, text to pl. 388.
Type, by monotypy, *Nectarinia chrysogenys* Temminck

Bill long, about twice the length of head or longer, stout and strongly curved, with the culmen ridged between the nostrils.

Disjunct distributional range

1 *longirostris* (1931), 2 extralimital subspecies.

Nepal (Fleming & Traylor, 1964), Darjeeling and Jalpaiguri districts (Ingis, JBNHS 26: 996), Bhutan and Arunachal foothills southwards in Meghalaya, Nagaland (?), Manipur and Bangladesh south to the Chittagong Hill Tracts; occurs mostly in the foothills up to c. 1500 m in Meghalaya, 1800 m in the Himalayas (scarce at these higher elevations); also found in adjacent plains (winter only?). Affects moist-deciduous and evergreen biotope: dense forest as well as glades and margins, secondary growth, heavy jungle along rivers, cardamom sholas, and wild and cultivated banana patches.

Extralimital. Extends through Burma to western Thailand south to the Isthmus of Kra; other subspecies in the Indochinese countries, Malay Peninsula, Indonesia and the Philippines.

GENERAL HABITS. Similar to those of sunbirds. Usually keeps singly or in pairs. Very fond of the nectar of wild banana blossoms, and is an

SUNBIRDS

55

long and stout, curved, black bill and yellow legs. *Above*, yellowish olive streaked with black. Tail tipped with buffish spots, with a blackish sub-terminal band. *Below*, very pale yellow with bold black shaft-streaks. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Resident, subject to vertical movements, locally common. Bilaspur in the Sutlej Valley (Stoliczka, *Jour. Asiatic Soc. Bengal*, 1868) but since then not recorded west of central Nepal (Biswas, JBNHS 60: 189), east through Sikkim, Darjeeling and Jalpaiguri districts, Bhutan and Arunachal Pradesh, thence south through Nagaland, Manipur, Meghalaya, and the hills of Bangladesh to the Chittagong Hill Tracts.

Arachnothera magna

Distributional range

1 *magna* (1932), 2 extralimital subspecies.

Breeds between c. 600 and 1500 m, occasionally 2200 m, extending well into the plains in winter. Affects dense evergreen forest and abandoned cultivation clearings, especially where wild banana and plantain trees are found. Occasionally also hill-station gardens with flowering shrubs.

Extralimital. Extends to northern Burma and Yunnan. Other subspecies in the Indochinese countries.

GENERAL HABITS. Found singly or in pairs, often in mixed parties of babblers and warblers, usually quite high up in trees. Difficult to observe because of its swift flight and preference for canopy of lofty trees in evergreen forest. Almost inseparable from wild banana trees whose blossoms it largely helps to cross-pollinate. Movements rapid and rather jerky. Explores leaves from all angles for insects and often hovers while probing flowers for nectar or for taking spiders from their web. Flight surprisingly strong and rapid with fast wing-beats and slight undulations.

FOOD. Nectar, insects and spiders.

54

NECTARINIIDAE

important agent in their cross-pollination. May commonly be seen clinging upside down to the purple bracts probing deep into the flowers with its long bill. *Loranthus* clumps and a very large variety of flowers are also visited.

FOOD. Nectar, insects and spiders.

VOICE and CALLS. Call-note, a harsh *cheep* or *chee-chee* rather reminiscent of both Paradise Flycatcher and Ashy Swallow-Shrike but somewhat higher-pitched and more musical. Song, a metallic, monotonous *which-which-which* etc. repeated at the rate of twice a second or so, maybe for two minutes or more at a stretch.

BREEDING. Season, in Assam March to September, chiefly May to August; in southwestern India December to August. *Nest*, a compact cup c. 10 cm deep, made of skeleton leaves, soft grass and vegetable down, neatly felted together; attached by its rim like an inverted dome to the underside of a banana or similar broad leaf by means of cobwebs or threads of vegetable cotton passed through the leaf and neatly knotted on its upper surface. There is a semicircular entrance-hole on one side. *Eggs*, usually 2, occasionally 3, pinkish white to salmon-pink, sparsely stippled all over with reddish with a sharply defined ring around the large end. Average size of 100 eggs 18.4 × 13.1 mm (Baker). Building of nest and incubation by both sexes. Period, undetermined. Brood-parasitism by Hodgson's Hawk-Cuckoo (*Cuculus fugax*, 575) recorded (Baker, JBNHS 17: 369).

MUSEUM DIAGNOSIS. See Field Characters. Young similar to adult.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	64-67	34-37	c. 15	{ 40-42 mm 36-38 mm (HW)
♀♀	59-60	32-33		

Weight 4 ♂♀ 11-15 g (SA).

COLOURS OF BARE PARTS. Iris brown. Bill horny brown, plumbeous at chin and on gony; mouth greyish pink with brown mottling. Legs, feet and claws bluish plumbeous. (In one immature female legs greyish blue, feet particoloured yellow and blue.)

1932. **Streaked Spiderhunter.** *Arachnothera magna magna* (Hodgson) (*Cinnyris*) *Magna* Hodgson, 1836, Ind. Rev. 1 (7): 272 (Nepal)

LOCAL NAMES. *Dom-sirich-pho* (Lepcha); *Tdong-pichang* (Bhutea).

SIZE. Sparrow; length c. 17 cm (6½ in.) including long bill.

FIELD CHARACTERS. A boldly streaked yellowish olive bird with very

× c. 1

56

ZOSTEROPIDAE

VOICE and CALLS. A sharp, metallic chirruping *chirirink* or *chirik*, *chirik* uttered both when feeding and on the wing. A soft song beginning clearly like *rijritte rij* then gaining speed and becoming a rapid, monotonous song. A soft *ug-ug-ug* when angry and a *chee-chee-chee* (in captivity — R. Hoppe, *Peacock* 4, No. 2: 48).

BREEDING. Season, March to July. *Nest*, a neatly finished inverted dome of skeleton leaves firmly fastened together with cobweb, lined with fine grass stems or skeleton leaves; it is sewn by means of vegetable down and cobwebs to the underside of a broad leaf, usually a banana leaf (cf. also 1931). *Eggs*, normally 2, sometimes 3, brown or olive-brown with a darker zone at the large end; for details on colour variations see Baker, *Nidification* 3: 232. Average size of 100 eggs 22.7 × 15.9 mm (Baker). Building and incubation by both sexes. Often brood-parasitized by cuckoos (*Cuculus micropterus*, *C. sparterioides* and other species).

MUSEUM DIAGNOSIS. See Field Characters. Young, like adult but streaks less sharply defined. Postjuvinal moult of body-feathers.

MEASUREMENTS

♀♀	78-84	42-44	20-22	39-48 mm (MD, SA)

Weight 2 ♂♂ (breeding) 28, 30; 1 o? 25 g (SA).

COLOURS OF BARE PARTS. Iris brown. Bill blackish brown. Legs and feet chrome-yellow to orange-yellow.

Family ZOSTEROPIDAE: White-eyes

For description see Baker, E. C. Stuart, 1926, FBI 3: 357; Van Tyne, J. & Berger, A. J., 1959: 541; Moreau, R. E., 1964, article 'White-eye' in Thomson, A. L. (ed.), *A New Dictionary of Birds*, London and New York.

Genus ZOSTEROPS Vigors & Horsfield

Zosterops Vigors & Horsfield, 1827, Trans. Linn. Soc. London 15: 234.

Type, by monotypy, *Zosterops dorsalis* Vigors & Horsfield = *Sylvia lateralis* Latham. Bill slender and small, about half the length of the head; culmen curved, tomium smooth, nostrils covered with a large membrane. Tarsus long and fairly strong. Tongue protractile and furnished with two brushes of stiff, horny fibres.¹ Wing long, of ten primaries, the first (as.) very minute. Tail short and square.

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. Above, yellow-olive; a very distinct white eye-ring; lores and a patch under eye blackish. Below, throat and under tail-coverts bright yellow; breast greyish white, belly whitish. Sexes alike.

× c. 1

STATUS, DISTRIBUTION AND HABITAT. Common resident, subject to seasonal movements. All India south of the Himalayan foothills from Kashmir through Nepal, Sikkim, Bhutan and Arunachal Pradesh, excluding western Rajasthan and the ranges of *salimalii* and *nilgiriensis*, qq.v. South to central Karnataka on the western and to the Godavari river on the eastern side of the Peninsula, extending eastward to Nagaland and Manipur, Bangladesh east to the Chittagong region. Pakistan from the Himalayan foothills (Murree) south to Karachi, but excluding most of Sind. Sri Lanka, low country and hills up to c. 1200 m in the wet districts, and to c. 1800 m in the dry portions. Laccadive Islands. Breeds more commonly in the hills especially in central India and the more southern parts of its range, but also in the better-wooded portions of the plains. In the Himalayas commonly breeds up to c. 1500 m, locally 2100 m (Kangra, Nepal; observed as high as 3000 m in May — GD), the majority moving down to the plains in winter. In the Peninsula also spreads to the plains from where it may be absent in summer. Affects forests, groves, gardens, orchards; colonizes isolated wooded compounds far out in desert country; also recorded in mangroves (Karachi).

WHITE-EYES

59

a feeble, plaintive *cheer* or *prree-u* (slightly falling) constantly uttered as the bird moves about. Other notes rendered as *tzip-tzip* and *sifststst* (Lister).

BREEDING. Season, April to September, mainly June-July. Nest, a small, fragile, loosely built cup of fine grass, rootlets, moss, lichen, cobweb and vegetable down, lined with hair, slung hammock-wise in a horizontal fork in a tuft of leaves at the end of a branch between one and six metres above the ground. Eggs, 2 to 4, generally 3, pale blue, unmarked. Average size of 48 eggs 15.2 × 11.5 mm (Baker). Building of nest apparently by female only. Incubation by both sexes, period about 10-11 days. Care of young by both parents.

MUSEUM DIAGNOSIS. Differs from *nilgiriensis* in being yellower above, and from *salimalii* in having a slightly larger bill and usually lacking a yellow streak on the centre of abdomen. Postnuptial moult complete.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	50-57	11-14	15-16	34-41 mm
♀♀	50-55	11-14		35-39 mm
			(BB, Mees, HW, SA)	

Weight 9 ♂♂ 7.5-10.1; 5 ♀♀ 7.6-10 g (GD).

COLOURS OF BARE PARTS. Iris yellowish brown. Bill black, lower mandible grey at base. Legs and feet plumbeous grey to grey-brown.

1934. Andhra White-eye. *Zosterops palpebrosa salimalii* Whistler

Zosterops palpebrosa salimalii Whistler, 1933, Jour.

Bombay nat. Hist. Society 36: 811 (Farahabad, SE. Hyderabad)
Baker, FBI No. 1247 (part), Vol. 3: 358

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. As in 1933, q.v.

STATUS, DISTRIBUTION AND HABITAT. Common resident, subject to seasonal movements. Andhra Pradesh from the Godavari river south in Tamil Nadu to about the Cauvery river. Chiefly confined to the hilly country. Habitat as in 1933.

GENERAL HABITS, FOOD AND VOICE. As in 1933.

BREEDING. As in 1933.

MUSEUM DIAGNOSIS. Differs from *palpebrosa* (1933) in being yellower above and having usually a faint yellow streak on centre of belly. Bill finer than in other races; this character not apparent from length measurement alone.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	53-57	11-12	14-16	37-40 mm
♀♀	51-55	11-12		35-39 mm
			(HW, SA)	

Weight 20 ♂♂ 6-11 (av. 8.6) g — SA.

COLOURS OF BARE PARTS. Iris hazel brown. Bill brownish slate, paler on lower mandible; mouth pink or yellowish pink. Legs and feet bluish grey; claws dusky.

58

ZOSTEROPIDAE

Zosterops palpebrosa

Distributional ranges

1 *palpebrosa* (1933). 2 *salimalii* (1934). 3 *nilgiriensis* (1935). 4 *nicobarica* (1936). 5 Extralimital subspecies.

Extralimital. Ranges east through northern Burma, southeastern Tibet, Szechuan, Yunnan and the Indochinese Peninsula (Mees, 1957). Other subspecies in Malaysia, the Sunda Islands and western Borneo.

GENERAL HABITS. Keeps in pairs or in parties comprising up to 50 birds or more, frequently in company with small babblers or other insectivorous species. Entirely arboreal, but comes down freely to bathe in garden runnels etc. Moves about from tree to tree keeping up a musical jingling or cheeping call and often clinging upside down to the sprigs while visiting foliage and blossoms in quest of food. Is one of our regular 'flower-birds' with specially adapted bill and tongue for nectar-eating, and largely responsible for cross-pollinating a wide variety of flowers.

FOOD. Insects, caterpillars, berries, buds, seeds and nectar. Almost invariably present on the flowers of *Bombax*, *Erythrina*, *Madhuca*, *Loranthus*, *Woodfordia*, etc. and of the introduced *Grevillea robusta* and various *Eucalyptus* spp. Partial to the exudation from the petioles of banyan leaves, and to ripe peepul figs. Reported to damage ripening orchard fruit, e.g. mangoes and guavas, by piercing holes for sucking the juice. Identified insect items include weevils (*Tanymecus hispidus* and *T. indicus*), ants (*Camponotus compressus*, *Phidole malinisi*?, *Polyrhinus simplex*) and small larvae (possibly Tineid) — Mason & Lefroy, 1912.

VOICE AND CALLS. Song, a tinkling jingle reminiscent of the Verditer Flycatcher's, beginning almost inaudibly, growing louder and soon fading out (SA). Song period in Nepal March to September (Proud). Gall-note,

Zosterops palpebrosa palniensis Koelz, 1939, Proc. Biol. Soc. Washington 52: 76 (Kodaikanal, Palni Hills)

Baker, FBI No. 1247 (part), Vol. 1: 358

Plate 106, fig. 3

LOCAL NAMES. *Vellikanni* (Malayalam); *Kannādi kūrūvi* (Tamil).

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. As in 1933, q.v.

STATUS, DISTRIBUTION AND HABITAT. Common resident, subject to seasonal movements. The hills of southern Karnataka (Biligirirangan), Kerala (from Coorg to the Ashambu Hills) and western Tamil Nadu (Nilgiris, Palnis, etc.), from c. 350 m up to the summits. Affects evergreen sholas, cardamom plantations, scrub jungle, gardens and orchards.

GENERAL HABITS, FOOD AND VOICE. As in 1933.

BREEDING. Season, February to May. Nest and eggs, as in 1933. Clutch size usually 2.

MUSEUM DIAGNOSIS. Differs from *palpebrosa* (1933) and *salimalii* (1934) in having a longer tail, larger bill, and in being greener above.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	54-58	13-14	15-17	34-42 mm
♀♀	53-57	13-15		36-41 mm
			(Mees, HW)	

COLOURS OF BARE PARTS. Iris buffy hazel brown. Bill horny brown, grey at gape and chin. Legs and feet slaty grey; claws brown.

1936. Nicobar White-eye. *Zosterops palpebrosa nicobarica* Blyth

Zosterops nicobaricus Blyth, 1845, Jour. Asiat. Soc. Bengal 14: 563 (Nicobar Islands)

Baker, FBI No. 1251, Vol. 3: 362

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. As in 1933.

STATUS, DISTRIBUTION AND HABITAT. Common resident. Andaman and the northern Nicobar islands (not recorded from Great and Little Nicobar). Affects gardens and evergreen forest.

GENERAL HABITS, FOOD AND VOICE. As in 1933.

BREEDING. Season, February to July. Nest and eggs, as in 1933. Average size of 31 eggs 16.2 × 12.2 mm (Baker).

MUSEUM DIAGNOSIS. Differs from peninsular subspecies in being greener, less yellow, and in having a larger bill.

WHITE-EYES

61

MEASUREMENTS

	Wing	Bill (from feathers?)	Tarsus	Tail
♂♂	54-56	13-14	{ 15-16	34-36 mm
♀♀	52-56			32-35 mm (Mees)

COLOURS OF BARE PARTS. Iris bright red-brown or light reddish brown. Bill above dark horny or slaty brown. Legs and feet greenish grey or slaty green.

1937. Ceylon White-eye. *Zosterops ceylonensis* Holdsworth

Zosterops ceylonensis Holdsworth, 1872, Proc. Zool. Soc. London: 459, pl. 20, fig. 2 (Nuware Eliya)

Baker, FBI No. 1256, Vol. 3: 366

Plate 99, fig. 2

LOCAL NAMES. *Māl-kurullā* (Sinhala); *Pā-kūriri* (Tamil).

SIZE. Sparrow —; length c. 11 cm (4 in.).

FIELD CHARACTERS. Above, entirely olive with a conspicuous white 'eyering'. Below, throat and under tail-coverts yellow; belly greyish white. Sexes alike.

Distinguished from *palpebrosa* by slightly larger size, stronger bill, and by being darker olive, less yellow above. Voice stronger and deeper in tone. STATUS, DISTRIBUTION AND HABITAT. Common resident. Sri Lanka in the hills above c. 900 m, locally down to c. 450 m (in the southwest). Affects forests, tea plantations and gardens.

GENERAL HABITS. Keeps in pairs in the breeding season, otherwise in large scattered parties; appears to be more sociable than *palpebrosa* and to be more partial to bushes and undergrowth though it is found just as often in the foliage of large trees. Parties often include *palpebrosa* as well as many other small insectivorous species.

FOOD. Nectar, berries, insects, caterpillars.

VOICE AND CALLS. Call-note, a sparrow-like *cheep*. A twittering continually uttered while foraging; voice stronger and deeper in tone than that of *palpebrosa*. A jingling song, suggestive of shaking a bunch of keys repeatedly, eight or nine times (Henry).

BREEDING. Season, end of February to July with a peak in April and a renewed activity in August and September. Nest, a small deep cup suspended by the rim in a slender fork amongst the foliage of a tree or bush, generally between 2 and 4 metres above the ground; this species more often selects a lower site than *palpebrosa*. *Grevillea* shade-trees in tea plantations, and coffee bushes, are often chosen. Nest made of green moss, rootlets, fine grass and fibres, lined with rootlets. Eggs, 2 more often than 3, pale blue, without spots. Average size of 33 eggs 16.5 × 12 mm, rather longer and less broad than those of the co-existing smaller species. Building of nest and care of young by both sexes; incubation most probably also by both.

MUSEUM DIAGNOSIS. See Key to the Species and Field Characters. Postnuptial moult complete, August to October.

in Sikkim up to c. 1300 m, replaced above by *P. montanus*; in the Nilgiris at all elevations but in the rest of southern India apparently absent or very local above c. 1000 m, even in populated areas. In the Cachar and Khasi

Passer domesticus

Distributional ranges

1 *indicus* (1938). 2 *parkini* (1939). 3 *bactrianus* (1939a). 4 *biblicus* (RE).

Hills and in the Chittagong region, absent from the hills. An unfailing commensal of man; affects cities and suburbs, villages, often even isolated homesteads, and human habitations of every description. In winter also cultivation and scrub jungle far from human dwellings.

Extralimital. Ranges from Arabia to Burma; introduced in South Africa, Zanzibar, Comoro and Mascarene islands. The species ranges from the Mediterranean region north to Lapland and east to Manchuria and the Amur region; introduced, and thriving, in most temperate parts of the world.

MIGRATION. A summer visitor (March to October) to higher elevations in Baluchistan and in the Himalayas.

HOUSE AND ROCK SPARROWS

65

GENERAL HABITS. Keeps in pairs when breeding, otherwise in noisy flocks. Usually found in or near human habitations, but in winter often collects in large flocks — sometimes mixed with migratory subspecies and of enormous 'pest' proportions — feeding in the countryside, in standing crops or in open scrub jungle. Generally gleans on the ground, hopping about stiffly, or plucks grain from the ear 'clinging to the panicles. Also feeds in fruiting trees or pilfers grain and seeds from dealers' shops in bazaars; occasionally catches termites and large insects on the wing. Birds nesting within houses frequently observed capturing moths and other insects coming to electric lights and feeding them to nestlings long after nightfall and until the lights are turned off. With increasing electrification in the country, this habit appears to be spreading; its impact on the local populations will need to be monitored. In the evenings large numbers collect to dust-bathe on roadsides and village squares etc., and roost in favourite trees to the accompaniment of a great deal of bickering and noise before settling down.

Display. A communal display has been described, consisting of three or four males courting a single female. The group suddenly bursts in from somewhere amidst noisy twitterings and drops down to the ground. The suitors prance and strut around the hen with puffed breast, drooping wings and cocked tail, she now and again making sudden feints at one or the other, sometimes plucking out a feather. See also Voice, below.

Food. Mostly grass- and weed-seeds and cereal grains. Also fruit- and flower-buds, tender shoots, kitchen scraps and insects. Nestlings are fed on soft-bodied insects, caterpillars, etc., this diet gradually replaced by a vegetarian one including flower-petals. Often does considerable damage to ripening cereal crops and in kitchen gardens and orchards, but largely compensates for this by the destruction of insect pests especially when rearing nest-young.

VOICE and CALLS. The all too familiar noisy chirruping. Breeding male has a loud monotonous song *cheer, cheer, cheer*, etc. uttered from a perch sometimes for fully ten minutes on end, as the bird fluffs out his plumage, arches his rump, droops his wings and struts arrogantly, twitching his slightly cocked tail (SA).

BREEDING. Season, chiefly March to June in the north continuing till September or October in central India; throughout the year in southern India. Nest, an untidy bulky collection (domed whenever possible) of straw, fibres, cotton strings or other rubbish, lined with feathers and placed in almost any kind of hole: hollows in buildings and masonry wells are most commonly used. Also holes in trees, earthbanks, and even cliffs (Quetta). Nests of swifts and swallows in occupied or deserted buildings often usurped and furnished to taste. Nesting has also been recorded in many other sites such as the angle behind a framed picture hung on a wall, the globes of lamps, inverted glass bell-jars in mosques, temples, etc. Will often attempt, with dogged persistence, to build in the most impossible places, especially within houses. The material drops down as soon as it is deposited on the site, and every evening a basketful of grass and rubbish may have to be swept off the floor below. But it takes the sparrow a long time to admit defeat! Occasionally builds a globular nest in the branches of trees, this.

HOUSE AND ROCK SPARROWS

67

MUSEUM DIAGNOSIS. Differs from *indicus* (1938) in being larger, with larger bill. Chestnut of male deeper, black of breast more extensive. Female darker, more smoky grey below.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	74-85	14-15	19-20	55-62 mm
♀♀	73-76	13-15		52-67 mm
				(BB, HW)

Weight 15 ♂♂ (Apr.-May, Kashmir) 24-30 (av. 26.5) g — SA.

COLOURS OF BARE PARTS. Iris brown to grey-brown. Bill: upper mandible pale brown, darker at tip; lower mandible fleshy, dusky at tip. Bill of male black from mid April. Legs and feet pale brown.

1939a. **Turkestan House Sparrow.** *Passer domesticus bactrianus* Zarudny & Kudashev¹

Passer domesticus bactrianus Zarudny & Kudashev, 1916, Nasha Okhota: 37 (Tashkent)
Not in Baker, FBI

LOCAL NAMES. None recorded.

SIZE. Bulbul — ; length c. 15 cm (6 in.).

FIELD CHARACTERS. As in 1938, q.v.

STATUS, DISTRIBUTION and HABITAT. Winter visitor to Rajasthan (and presumably Pakistan).

Extralimital. Breeds from Russian Turkestan and northern Afghanistan west to the Caspian Sea.

MIGRATION. Inclusion in Indian list made possible by ringing data. Six examples recently ringed at a mixed roost in Rajasthan (Bharatpur, 27°14' N., 77°28' E.) in winter as 'parkini' were later recovered on their breeding grounds chiefly in the Tadzhik-SSR of Kazakhstan between 37°30' and 42°30' N., and 69°20' and c. 76° E., their subspecific identity confirmed as *bactrianus* by E. I. Gavrilov. Straight-line map distance between places of ringing and recovery c. 1500-2000 km (over the Karakorams).

GENERAL HABITS, FOOD and VOICE. As in 1938 and 1939. Keeps to the countryside often in vast mixed swarms with Spanish Sparrows (1940) ravaging cereal crops, and roosting communally in thorn thickets.

BREEDING. Extralimital.

MUSEUM DIAGNOSIS. Differs from *parkini* in being paler. Wing averages longer than in *indicus* but shorter than in *parkini*.

Wing ♂♂ 75-81; ♀♀ 72-78 mm. Weight 46 ♂♂ 21-28; 36 ♀♀ 21-28 g (Paludan, Afghanistan).

COLOURS OF BARE PARTS. As in 1939.

¹ Some authors consider this subspecies synonymous with both *parkini* and *griseigularis*. However, *Passer [domesticus] griseigularis* Sharpe, 1888, Cat. Bds. Brit. Mus. 12: 313 (Kandahar) is currently considered unidentifiable as to subspecies.

66

PASSERINAE

being a very common occurrence in the Quetta Valley. Eggs, 3 to 6, usually 4, very pale greenish white blotched and spotted with brown and ashy grey. Average size of 120 eggs 20.6 × 14.9 mm (Baker). Building of nest by both sexes. Female does all the incubation but male may sometimes take a turn for a minute or two; incubation period 14 days. Care of young by both parents. Several successive broods are reared.

MUSEUM DIAGNOSIS. See Key to the Subspecies. Postnuptial moult complete, no spring moult. Postjuvinal moult complete. Young males begin to breed soon after assuming adult plumage, even before their skulls are perfectly ossified (SA, JBNHS 36: 903).

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	70-82	13-15	18-20	49-61 mm
♀♀	70-80	13-15	18-20	51-57 mm
				(SA, BB, HW)

Weight 3 ♂♂ 22-33; 2 ♀♀ 21, 21 g (BB).

COLOURS OF BARE PARTS. Iris brown. Bill: ♂ dark brown, black in breeding plumage; ♀ pale brown. Legs and feet brownish flesh.

1939. **Kashmir House Sparrow.** *Passer domesticus parkini* Whistler

Passer domesticus parkini Whistler, 1920, Bull. Brit. Orn. Cl. 41: 13 (Srinagar, Cashmere)
Baker, FBI No. 1098, Vol. 3: 173

LOCAL NAMES. None recorded.

SIZE. Bulbul — ; length c. 15 cm (6 in.).

FIELD CHARACTERS. As in 1938, q.v.

STATUS, DISTRIBUTION and HABITAT. Common resident, subject to vertical movements; also partial migrant. The Himalayas from Baltistan, Kashmir and Ladakh east to Sikkim, breeding mostly above c. 2000 m. [Population of Nepal Valley somewhat intermediate between *parkini* and *indicus* but closer to the former (BB).] In Ladakh breeds up to c. 4000 m, even 4500 m or wherever there is permanent cultivation. In winter moves to lower altitudes and to the plains as far south at least as Bahawalpur, Sind and Rajasthan. [Wintering population in the plains mixed with *bactrianus*, and subspecies often equivocal.] Affects human settlements and cultivation.

GENERAL HABITS, FOOD and VOICE. As in 1938. Keeps in large mixed flocks in winter feeding in cereal cultivation and causing considerable damage to the crops; roosting in enormous congregations among thorn thickets, swarm after swarm flying in at sunset.

BREEDING. Season, April to August in Kashmir, June to August in Ladakh. Nest, as in 1938, placed in holes in earth-cliffs in loose colonies; often high up in poplar trees (in this case bulky globular grass structures sometimes several in the same tree). Eggs, 3 to 7, normally 5 or 6, similar to those of *indicus*. Average size of 78 eggs 21.7 × 15.4 mm (Osmaston).

68

PASSERINAE

1940. **Spanish Sparrow.** *Passer hispaniolensis transcaspicus* Tschusi

Passer hispaniolensis transcaspicus Tschusi, 1902, Orn. Monatsb. 10: 96
(¹ Transcaucasia = Iolotan, Transcaspija)
Baker, FBI No. 1100, Vol. 3: 175
Plate 100, fig. 3

LOCAL NAMES. None recorded.

SIZE. Sparrow; length c. 15 cm (6 in.).

FIELD CHARACTERS. Male. Above, crown and nape chestnut. Back black with whitish streaks. Wings pale brown. Below, cheeks white. Throat and breast black. Rest of underparts whitish streaked with dark brown on flanks. Chestnut crown and conspicuously streaked flanks distinguish the male from the House Sparrow; black of breast more extensive on sides.

Female has faint streaking on breast but not distinguishable from House Sparrow unless in the hand, and then not always with certainty.

STATUS, DISTRIBUTION and HABITAT. Winter visitor, locally abundant, and passage migrant. The plains of Punjab and Haryana from Kohat east to

Passer hispaniolensis

[] Main winter range of *transcaspicus* (1940). [X] Isolated record.

Ambala (an old record from Mirzapur, U.P.) south to northeastern Rajasthan (Bharatpur, Sambhar Lake) and Bahawalpur; rare in northern Baluchistan (Chaman, Murghab and Quetta); a straggler to Sind. Affects cultivation and semi-desert.

Extralimital. Breeds from Tien Shan and Tarim Basin west to the Caucasus and south to Afghanistan and Iran. Nominant subspecies in the Mediterranean countries.

HOUSE AND ROCK SPARROWS

69

MIGRATION. Passes through N.W.F.P. in very large flocks between August and November and from the middle of March to the middle of May. On passage often associated with *Sturnus roseus*. Rare transient in Gilgit. Six examples ringed in the winter quarters in Bharatpur (27°14'N., 77°32'E.) recovered on the breeding grounds in Kazakhstan between 42°31' and 46°49'N. and 70°31' and 79°33'E., and one bird vice versa. These data establish the provenance of at least a part of our wintering population and also that both this species and *P. d. bactrianus*, usually seen together in mixed flocks, derive from a common area in Russian Turkestan (cf. 1939a).

GENERAL HABITS. A very gregarious species usually seen in large foraging flocks and enormous roosting congregations (once estimated at a million birds or more in Bharatpur, March–April — SA); often in mixed company with migratory House Sparrows, chiefly *P. d. bactrianus* (1939a).

FOOD. Chiefly grain and seeds, also insects.

VOICE AND CALLS. Similar to those of the House Sparrow.

BREEDING. Extralimital. For details on breeding biology in Kazakhstan see Gavrilov, E. I., 1963, JBNHS 60: 301–17.

MUSEUM DIAGNOSIS. See Field Characters and Key to the Species. Bill rather hawfinch-like in profile, broad and flat-convex dorsally near forehead. Tarsus stouter than in *P. d. parkini* or *bactrianus*.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	73–87	c. 16	19–20	57–62 mm
♀♀	73–82	(one) 14		— mm

(Baker, SA, MD)

Weight. India: 100 ♂♂ (March–April) 20–28 (av. 24.9); 100 ♀♀ (March–April) 18–28 (av. 23.49) g. ♂♂ (Oct.) 29–33 g — SA. *Seistan*: ♂♂ (March–April) 23–31; ♀♀ (March–April) 27–31 g — Paludan. *Kazakhstan*: ♂♂ (April–Aug.) 28.5–29.3; ♀♀ (May–Aug.) 26.7–29.8 g — Gavrilov.

COLOURS OF BARE PARTS. Iris dark brown. Bill horny brown, yellowish below and at base (♂ black in summer). Legs and feet horny brown.

LONGEVITY. A first-year ♂ ringed Bharatpur, February 1962, recovered almost exactly 9 years later — February 1971 — in Pakistan (c. 33°N., 73°E.), presumably on northward passage and apparently perfectly hale and hearty.

HOUSE AND ROCK SPARROWS

71

BREEDING. Season, April to August. Nest and eggs, as in 1942. Average size of 40 eggs 19.8 × 14.1 mm (Baker).

MUSEUM DIAGNOSIS. Differs from both *malaccensis* and *tibetanus* in being much paler:

MEASUREMENTS

Wing ♂♂ 78–83; tarsus 18–19; tail 50–55 mm (Baker).

COLOURS OF BARE PARTS. As in 1942.

1942. Malay Tree Sparrow. *Passer montanus malaccensis* Dubois

Passer malaccensis Dubois, 1885, Faune III. Vert. Belg., Ois. 1: 572 (Malacca)

Baker, FBI No. 1102, Vol. 3: 177

Plate 100, fig. 7

LOCAL NAMES. *Chhōti gowriyā* (Hindi); *Konchikā* (Assam); *Sendung* (Manipur).

SIZE. House Sparrow; length c. 15 cm (6 in.).

FIELD CHARACTERS. Above, crown and nape chocolate-brown. Sides of head white with a black patch on ear-coverts. Rest of upperparts brown streaked with black on back. Below, chin and centre of throat black. Rest of underparts greyish white. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Common resident. The lower Himalayas from western Nepal and probably Naini Tal¹ [where Whympere obtained nests and eggs at 2700 m (Baker, *Nidification* 3: 79)]; also C. Hudson, JBNHS 34: 825] east through Darjeeling, Sikkim and Bhutan; Assam, the Cachar, Khasi and Garo hills, and adjacent tracts of Bangladesh. Occurs up to c. 2000 m in Nepal, 2700 m in Sikkim (SA) and 1800 m in Bhutan, in the latter country intergrading with *tibetanus* at the higher levels. Affects villages and fields.

Extralimital. The Indochinese countries and Sunda Islands to Bali. Introduced in the Philippines, south Celebes, Lombok and Ambon. For range of the species see 1941.

GENERAL HABITS. Keeps in pairs in the breeding season, otherwise in flocks. Takes the place of the House Sparrow in villages and surrounding fields.

FOOD. Grain, seeds, insects and kitchen scraps.

VOICE AND CALLS. Chirping notes like House Sparrow's but more musical.

BREEDING. Season, March to August; two broods are reared. Nest, an untidy collection of straw, lined with feathers, placed under eaves, in the thatching of roofs or in holes in trees, walls or banks. Nesting in holes in walls of monasteries and dzongs in Bhutan side by side with *P. rutilans*. Eggs, 4 to 6, similar to those of the House Sparrow, with the same variations. Average size of 100 eggs 19.2 × 14.2 mm (Baker). Building of nest by both sexes. Incubation (by both?), period 13 days. Care of young by both parents.

MUSEUM DIAGNOSIS. Differs from *tibetanus* in being smaller, paler, and with a fawn-brown rump. Postnuptial and postjuvinal moults complete.

¹This record and other reports from the western Himalayas need confirmation, i.e. Chamba (Marshall, *Ibis* 1834: 419, listed without comment) and Sutlej Valley near Chini (Stoliczka, JASB 37, "only rarely seen").

70

PASSERINAE

1941. Afghan Tree Sparrow. *Passer montanus dilutus* Richmond

Passer montanus dilutus Richmond, 1896, Proc. U.S. Nat. Mus. (1895) 18: 575 (Kashgar, Eastern Turkestan)
Baker, FBI No. 1103, Vol. 3: 178

LOCAL NAMES. None recorded.

SIZE. House Sparrow; length c. 15 cm (6 in.).

FIELD CHARACTERS. As in 1942 but paler.

STATUS, DISTRIBUTION AND HABITAT. Common resident, subject to seasonal movements. Pakistan in northern Baluchistan [Chaman and Quetta district south at least to Kalat (Ticehurst, JBNHS 31: 866) and Chagai (Christison, *Ibis* 1941: 538)] and N.W.F.P. north to Chitral, east possibly to Gilgit (Baker, *Nidification* 3: 80) and Murree hills (nest taken by Ratray *vide* Baker,

Passer montanus

Distributional ranges

- 1 *dilutus* (1941). 2 *malaccensis* (1942).
3 *tibetanus* (1943). 4 *hepaticus* (1944).

ibid. 3: 79, under *malaccensis*). Breeds between c. 450 and 2200 m. In winter reaches the Makran coast in small numbers. Population of Chaman and Quetta augmented by migrants. Affects human settlements (while the House Sparrow is here found mostly in the countryside).

Extralimital. Ranges from eastern Iran to Manchuria and China south to Szechuan and Kwangtung. The species ranges from the European Atlantic coast to the Sea of Okhotsk, Taiwan and the Sunda Islands. Has been introduced into Australia and North America (where, unlike *domesticus*, it has not spread).

GENERAL HABITS, FOOD AND VOICE. As in 1942.

72

PASSERINAE

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	67–76	11–14	15–19	52–57 mm
♀♀	66–74	(mostly 12–13)		50–56 mm

(BB, Rand & Fleming, SA)

Weight 2 ♂♂ 20.3, 20.5; 2 ♀♀ 20.5, 21.3 g (GD, BB). 1 ♂ (March) 20; 13 ♀♀ (March) 18–24 (av. 20.1) g — SA. May include some intergrades with *tibetanus*.

COLOURS OF BARE PARTS. Iris dark brown. Bill blackish in the breeding season, otherwise brown with yellowish on base and gape. Legs and feet fleshy brown.

1943. Tibetan Tree Sparrow. *Passer montanus tibetanus* Baker

Passer montanus tibetanus Baker, 1925, Bull. Brit. Orn. Cl. 45: 92

(Khumbajong, Tibet)

Passer montanus maximus Schäfer, 1938, Proc. Acad. Nat. Sci. Philadelphia 89: 385 (Jyekundo, southern Tsinhai)

Baker, FBI No. 1104, Vol. 3: 179

LOCAL NAME. *Kang-che* ('house bird', Tibetan).

SIZE. House Sparrow; length c. 15 cm (6 in.).

FIELD CHARACTERS. As in 1942, q.v.

STATUS, DISTRIBUTION AND HABITAT. Common resident, subject to short seasonal movements. Tibet and the Tibetan facies of northern Nepal (Manangbhot, c. 3900 m — Lowndes, JBNHS 53: 34, as *malaccensis*), Sikkim, Bhutan and Arunachal. In Nepal its range is not contiguous with that of *malaccensis*, being separated by a humid forest zone; in eastern Nepal does not occur south of the passes (GD); in Bhutan intergrades with *malaccensis* between 1800 and 2700 m. In winter may descend the main valleys to c. 2800 m (Rand & Fleming, west-central Nepal). Affects villages and fields.

Extralimital. Ranges north to Tsinhai, Kansu and western Szechuan.

GENERAL HABITS. Collects in large flocks in autumn, roaming in barley fields, where they consume a considerable amount of grain. Generally keeps to the neighbourhood of houses and monasteries in winter, but may wander far afield in summer.

FOOD AND VOICE. As in 1942.

BREEDING. Season, April to July. Nest and eggs as in 1942. Clutch size 3 to 5. Average size of 19 eggs 20.7 × 14.7 mm (Ludlow), of 50 eggs 20.8 × 15.1 mm (Baker).

MUSEUM DIAGNOSIS. Differs from *malaccensis* in being larger, darker, and with a greyish brown rump.

MEASUREMENTS

(Buhawalpore, Scinde)

Baker, FBI No. 1099, Vol. 3: 174

Plate 100, fig. 5

LOCAL NAMES. None recorded.

SIZE. House Sparrow —; length c. 12 cm (5 in.).

FIELD CHARACTERS. Male, very similar to House Sparrow but smaller; black restricted to chin and throat, not extending to breast. Rest of underparts pale ashy.

Female, not distinguishable from House Sparrow.

STATUS, DISTRIBUTION and HABITAT. An endemic species. Resident, common but very locally distributed. The plains of the Indus from Nowshera (c. 34°N.), the Jhelum district, Gurdaspur, Ferozepore and Ludhiana (Whistler, JBNHS 20: 1151) south to Sadhani, Hyderabad (c. 25°N.) and the Nara canal in Sind. For details of recorded distribution up to 1925 see Whistler, *ibid.* 30: 413. Essentially a riverain sparrow: affects tamarisk and acacia jungle mixed with tall grass along rivers and around jheels and swamps; also *Capparis* and *Salsadora* bushes and jungle in semi-desert but in the neighbourhood of water.GENERAL HABITS. Usually seen in flocks of 5 to 20 birds, occasionally as part of immense foraging flocks of *Passer domesticus*. Co-exists with *P. domesticus* where human habitations lie near riverain forest and tamarisk jungle (Holmes & Wright, JBNHS 66: 27). 'Behaviour of flock reminiscent of Siskins or Redpolls, merely flying a few yards when approached, and then continuing their busy search for food' (Whistler, JBNHS 20: 1151). Feeds

PASSERINAE

Passer pyrrhonotus and *P. rutilans*

Distributional ranges

1 *P. pyrrhonotus* (1945).2 *P. r. cinnameus* (1946).3 *P. r. intensior* (1947).

on the flats along rivers; also in bushes and trees or on the flowering heads of tall grasses. Roosts in parties in thorn thickets, or tamarisk bushes standing in water.

FOOD. Chiefly grass and weed seeds (*Polygonum plebeja* particularized by T. R. Bell, MS. notes); also insects.

VOICE and CALLS. 'Voice very like House Sparrow's but much clearer and purer' (T. R. Bell). Song consists of the usual sparrow chirrups interspersed with a note, often repeated, resembling the call-note of the Pied Wagtail (A. J. Currie).

BREEDING. Season, end of February to September; apparently two broods are reared. Nest, an untidy globular mass of tamarisk twigs, grass and roots, with the entrance near the top, lined with feathers; usually placed in the tops of tamarisk trees or in dense thorny bushes or suspended from finer twigs at the end of long branches, from two to five metres above the ground. Has been observed to breed in old Baya nests (Jones, JBNHS 21: 1073). Nests in small loose colonies. Eggs, 3 or 4, similar to those of the House Sparrow. Average size of 100 eggs 17.8 × 13.1 mm (Baker). Building of nest and incubation by both sexes.

MUSEUM DIAGNOSIS. See Key to the Species. Pattern similar to that of the House Sparrow but band behind eye a redder chestnut; ear-coverts ashy grey; lower back tinged with chestnut. Black of throat narrower and does not spread out on breast. Outer webs of greater coverts and primary-coverts less rufous-chestnut. Female like a small House Sparrow but spot behind eye darker and ear-coverts more ashy. Postjuvénal moult complete.

Plate 100, fig. 6

LOCAL NAMES. *Lāl gowiyā* (Hindi); *Kang-che-go-ma* ('red-headed house bird', Tibetan); *Pichi* (Dalla).

SIZE. Sparrow; length c. 15 cm (6 in.).

FIELD CHARACTERS. Male. Above, bright rufous-chestnut streaked with black on back. A broad and a narrow white wing-bar. Below, chin and centre of throat black, sides of throat pale yellow. Breast and flanks yellowish grey; centre of belly pale yellow.

Female. Above, brown streaked with dark brown on back. A conspicuous whitish supercilium and white wing-bars. Below, pale yellowish ashy.

STATUS, DISTRIBUTION and HABITAT. Common resident, subject to vertical movements. The Himalayas from Chitral and Kashmir (not recorded in Ladakh) east through Arunachal and southern Tibet. In the western Himalayas (Chitral to Simla) breeds between 1800 and 2400 m, in Kashmir up to 2700 m, in Kulu and Kangra down to 1200 m. In western and central Nepal (where apparently scarce) noted between 1800 and 2400 m and found breeding as low as 370 m (Fleming & Traylor, 1968). No records from the eastern half of Nepal. Status poorly known in Sikkim. In Bhutan breeds above 1800 m, and up to 4200 m in southeastern Tibet. Observed in winter between 500 and 1500 m in the western Himalayas, sometimes down in the

76

PASSERINAE

adjacent plains (Chandigarh), below c. 1000 m in Sikkim and in the plains of Jalpaiguri district (JBNHS 26: 995), in the Bhutan and Arunachal foot-hills and adjacent plains (Stevens, JBNHS 23: 264). Affects light forest of oak, rhododendron, alder, etc., terraced cultivation in the vicinity of hill villages and human habitations, taking the place of the House Sparrow where the latter does not occur. In winter also noted in grassland (Lakhimpur) and in barley fields.

Extralimital. Breeds in southern Tibet (where migratory, arriving in April) as far west as Goara, western Tibet (Stoliczka). The species ranges north to Kansu, Shensi, Korea and Sakhalin, east to Japan, Taiwan and Laos; also Kafiristan (eastern Afghanistan).

GENERAL HABITS. Usually keeps in flocks outside the breeding season. Gleans grain and grass seeds on the ground as well as plucks them from growing stalks. Is fond of perching in exposed situations such as the top branches of dead trees, telephone wires in hill-stations, etc.

FOOD. Chiefly grain and seeds; also berries and insects.

VOICE and CALLS. Call-note *chilp*... *chilp* similar to House Sparrow's but softer, more musical. Also *sree*... *sree* like an Indian Robin's notes (SA); Song *chee-cha-cha* repeated over and over (Smythies).BREEDING. Season, April to August, chiefly May and June. Double-brooded. Nest, a pad of dry grass, pine needles, etc. lined with hair and feathers, placed in holes in trees (up to 9 metres above the ground), in the thatching of huts and under the eaves of houses, often competing with and ousting tits from holes in walls of hill-station bungalows. In Bhutan nests freely in holes in outer walls of inhabited dzongs and monasteries side by side with *P. montanus*. In Tibet where trees are scarce, hollows in banks or old mud chortens, between stones in bridges or other similar situations are patronized. Eggs, usually 4, sometimes 5, generally more heavily marked than those of *P. domesticus*. Average size of 40 eggs 19.1 × 13.9 mm (BBO), of 60 eggs 18.9 × 13.9 mm (Baker). Building of nest and incubation by both sexes.

MUSEUM DIAGNOSIS. See Field Characters and Key to the Species.

Young male, like adult male but crown brown; chestnut of upperparts duller. Underparts greyish white, whiter on cheeks and belly; a dusky throat-patch. Young female, like adult female but paler above; underparts creamy white. Postjuvénal moult complete.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	68-82	12-14	17-21	46-56 mm
♀♀	60-78			46-53 mm

Not in Baker, FBI

Plate 100, fig. 4

LOCAL NAMES. None recorded.

SIZE. House Sparrow —; length c. 12 cm (5 in.).

FIELD CHARACTERS. Male. Above, crown and upper back grey. Rest of upperparts sandy brown streaked with dark brown on centre of back. A long, conspicuous whitish supercilium, buff behind eye. Ear-coverts grey. Shoulder black; a rufous-chestnut wing-patch with two buff bars. Rest of wing and tail blackish brown margined with buff. Below, chin and centre of throat black bordered by white malar streaks. A yellow patch on sides of throat. Breast and flanks very pale yellowish brown, belly pale yellow. In winter grey of crown tipped with sandy brown and black of throat tipped with white.

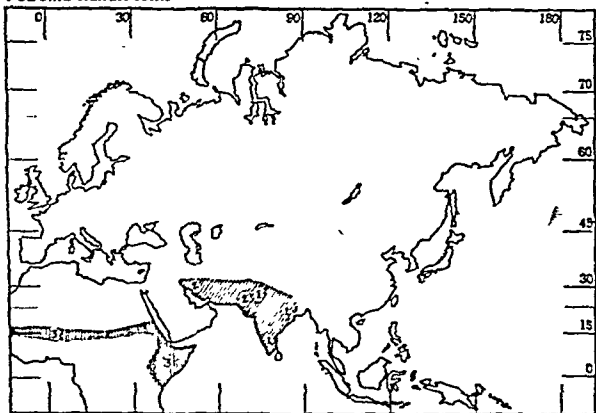

Female. Above, sandy brown streaked with darker brown on back. A whitish supercilium and two whitish wing-bars. Below, pale sandy brown with yellow throat-patch and streaked with pale yellow on belly. Female lacks rufous on wing and black on wing and throat.

(Ganges between Calcutta and Benares)

Baker, FBI No. 1094, Vol. 3: 166

Plate 100, fig. 9

LOCAL NAMES. *Rāji*, *Jāngli-chirāī* (Hindi); *Bān-chārāī* (Bengali); *Mahorai*, *Daideim* (Chota Nagpur); *Adari-pichike*, *Konde-pichike*, *Cheruka-pichike* (Telugu); *Marijatali* (Malayalam).

SIZE. Sparrow —; length c. 14 cm (5½ in.).

FIELD CHARACTERS. Above, grey-brown, wings and tail darker, with a chestnut shoulder-patch and two whitish wing-bars (upper broader and more prominent). Below, pale grey-brown with a yellow throat-patch; chin and belly whitish. Tail slightly but distinctly forked. Sexes more or less alike; throat-patch in female much paler, and shoulder-patch rufous not chestnut.

STATUS, DISTRIBUTION and HABITAT. Common resident and marked local migrant.

The whole Indian Peninsula east of the range of *transfuga* (Kutch to Punjab, where intergrades are found) north to the foothills of Uttar Pradesh and Nepal, east to the eastern terai, Bihar and lower Bengal and south to Kanyakumari (Cape Comorin). A summer visitor in the Himalayan foothills, up to c. 750 m (Dehra Dun). In parts of central India (Mhow, Sehore, Gwalior, Betul) disappears during the rainy (post-breeding) season; common as a winter visitor appearing irregularly between September and November. Noted as mostly a winter visitor in Delhi, Tamil-Nadu and Coorg, and a local migrant in Karnataka, Kerala, the Deccan plateau, etc. Movements apparently governed by rain. In Kerala occurs mostly in the low country but locally up to c. 1000 m (Maraiyur); in the Nilgiris up to c. 1200 m. A rare vagrant to Sri Lanka (a flock met with in October — Legge). Affects open dry-deciduous forest and thorn jungle, groves, hedges and trees near villages and cultivation.

GENERAL HABITS. Collects in flocks after breeding, sometimes in considerable numbers ('100 +', SA), often mixed with House Sparrows or Blackheaded Buntings, roosting with them communally in thorn thickets and shrubbery. During the heat of the day flocks congregate in leafy trees and

HOUSE AND ROCK SPARROWS

81

spend the hours in noisy chattering. Flocks break up in February–March, re-forming after May–June. Feeds mostly on the ground.

FOOD. Grain (of rice and other cereals), seeds of grass and weeds, vegetable matter, lantana berries, ants, caterpillars, beetles and other insects. Among insect items specifically recorded in the stomach contents in an intensively cultivated area in Bihar are weevils (*Myliocerus discolor*, *Tanyecus hyssida*), scarab beetle (*Onthophagus spinifer*), ant (*Oecophylla smaragdina*) and Geometrid larvae (Mason & Lefroy, 1912). Also takes regularly the nectar of *Capparis*, *Salmaia*, *Erythrina*, *Bastia*, etc.; 'in quest of this the forehead becomes golden with adhering pollen and gives to the birds an unusually distinguished and intriguing appearance in the distance' (SA).

VOICE AND CALLS. Call-notes resemble those of the House Sparrow but are mellow in tone. Song, a pleasant but monotonous *chilp-chalp* uttered for long periods from a perch in vicinity of nest.

BREEDING. Season, end of February to end of May (dry season), later in the extreme north. Nest—often in a loose colony—a small pad of hair, feathers and grass placed in holes usually between one and six metres above the ground in a variety of situations: hollows and cracks in tree-trunks, old woodpecker or barbet holes, in roofs of bungalows, nest-boxes, disused street lamps, vent pipes; once under the roof of a church 15 metres high; and in disused (or dispossessed?) nest of *Hirundo daurica* (927). Site often given away by male who spends the greater part of the day sitting nearby, chattering loudly and monotonously. Eggs, 3 or 4, white generally tinted with brown or sometimes pale greenish, with smudges, smears, streaks and blotches varying from grey-brown to dark sooty brown. Average size of 100 eggs 19 × 13.9 mm (Baker). Female does all the building, the male merely accompanying her (but according to Gill, both birds assist). Incubation by female only; period undetermined. Care of young by both parents.

MUSEUM DIAGNOSIS. Differs from *transfuga* in being greyer brown, less sandy. Postnuptial moult complete; no spring moult. Postjuvinal moult complete.

MEASUREMENTS	Wing	Bill (from skull)	Tarsus	Tail
♂♂	77–89	13–16	16–18	46–52 mm
♀♀	76–85			43–55 mm
				(HW, SA, Roonwal)

Weight 9 ♂♂ 15–20 (av. 18); 9 ♀♀ 14–20 (av. 18) g—SA. 5 ♂♂ (Feb.–April) 17–20; 1 ♀ (March) 18.5 g—GD, Roonwal.

COLOURS OF BARE PARTS. Iris brown. Bill: in female and non-breeding male, upper mandible pale brown, lower pinkish brown; in breeding male black. Legs and feet greyish brown or brownish flesh.

p. 482, ex Moore ms. (Ladakh)

Baker, FBI No. 1111, Vol. 3: 187

Plate 94, fig. 12

LOCAL NAMES. *Richi-kye-shok*, *Abe je* (Tibetan).

SIZE. Sparrow +; length c. 17 cm (6½ in.).

FIELD CHARACTERS. Above, grey-brown with darker streaks on back. Wing dark brown with large white patches on shoulder and tertials. Central rectrices dark brown, next white tipped with dark brown. Below, cream colour with a blackish throat-patch. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Fairly common resident, subject to vertical movements. Breeds in Ladakh, Spiti and Nepal (J. Martens, pers. com.) between 3600 and 4500 m., and in northern Sikkim at c. 4900 m. (Schäfer, in *Salim Ali Birds of Sikkim*: 365). Obtained in winter in Kulu and the upper Sutlej Valley. Affects high stony plateaux, boulder-strewn hillsides and scree fans, and neighbourhood of upland villages, etc.

Extralimital. Tibet north to Tsinghai and east to Szechuan.

GENERAL HABITS. Usually very wild; sometimes amazingly tame and fearless. Keeps in pairs in the breeding season, in small flocks thereafter, and in huge flocks up to 2000 or 3000 birds in winter. Feeds on the ground commonly on edges of melting snow patches, running like a lark, not hopping. Flight very undulating, more buoyant than in other snow finches.

Display. Every now and then, during the breeding season, the male (?) launches himself in the air from some hill slope and with wings upstretched like the letter V, white tail-feathers outspread like a fan, hovers for a while, and then gently descends to earth, uttering a short, plaintive little song (Ludlow, *Ibis* 1928: 67). Also displays on the ground, loosely waving extended wings and jerking outspread tail.

FOOD. Insects and seeds.

VOICE AND CALLS. Call-note a chaffinch-like *pink pink* and a soft mew (HW). Song monotonous but fairly distinctive, uttered from a rock or in display flight (see above).

BREEDING. Season, May to August, chiefly June and July. Nest, a collection of grass lined with wool, feathers, and hair (of yak, marmot, etc.) placed deep down in holes in cliffs or 'mané' walls, burrows of mouse-hares (*Ochotona*), or more frequently under a fair-sized rock. Eggs, 4, white. Average size of 21 eggs 22.9 × 16.9 mm (Osmaston). Incubation probably by both sexes. Care of young by both parents.

82

PASSERINAE

SIZE. House Sparrow +; length c. 17 cm (6½ in.).

FIELD CHARACTERS. Above, pale brown streaked with darker brown. Sides of crown and a streak behind eye dark brown; a broad, pale supercilium. Tail tipped with white spots. Below, brownish white with darker streaks; a yellow patch on centre of throat. Sexes alike.

x c. 1

STATUS, DISTRIBUTION AND HABITAT. Winter visitor to Gilgit (common around c. 1500 m), N.W.F.P. (Attock, Kohat), south to Mianwali and Quetta (Baluchistan, straggler). Affects stony or rocky ground.

Extralimital. Breeds from Sinkiang west to the Caspian Sea and south to northern Afghanistan and Iran. The species extends from the Mediterranean countries to Transbaikalia and northern China.

MIGRATION. Occurs in winter quarters from the third week of November to the end of March (latest 2 April).

GENERAL HABITS. Gregarious in winter; usually met with in small flocks. Prefers stony desolate places and often feeds in stubble fields. Rather shy.

FOOD. Seeds; freshly sown wheat recorded.

VOICE AND CALLS. A harsh sparrow-like chirp.

BREEDING. Extralimital; in holes and fissures in rock scarps.

MUSEUM DIAGNOSIS. See Field Characters.

MUSEUM DIAGNOSIS. See Field Characters and Key to the Species.

Young, marked as adult but chin and throat white, the feathers dusky at base. Mantle browner. Primary-coverts brown with only a little white at base. White parts of coverts and tail tinged rusty. Tertials edged rufous-brown. Postjuvinal moult complete.

MEASUREMENTS	Wing	Bill (from skull)	Tarsus	Tail
♂♂	109–117	16–17	21–22	66–75 mm (HW, SA)
♀♀	106–113			

COLOURS OF BARE PARTS. Iris brown. Bill black (♂), horny brown, yellowish, at base, black at tip (♀). Legs and feet black.

1953. Mandelli's Snow Finch. *Montifringilla taczanowskii* (Przevalski)

Onychospiza Taczanowskii Przevalski, 1876, Mongol. Strana Tangut 2: 81, pl. 11

(Tetung and Kuku Nor Steppe)

Baker, FBI No. 1112, Vol. 3: 188

Plate 94, fig. 14

LOCAL NAME. *Go-pang* (Tibetan).

SIZE. Sparrow +; length c. 17 cm (6½ in.).

FIELD CHARACTERS. Above. Forehead and supercilium whitish; lores black. Back ashy brown streaked with darker brown; rump white. Wings brown with broad ashy white outer edges and white wing-patch. Tail dark brown tipped white. Below, ashy white. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Recorded in northern Sikkim (September–October, Mandelli, SF 8: 503); a specimen from northern Sikkim (October) in Inglis's Collection (HW, MS.). Possibly also Ladakh (Ward, JBNHS 17: 458). Affects Tibetan steppe.

Extralimital. Tibet north to Tsinghai, west to Gartok on the Indus in western Tibet (Ludlow).

GENERAL HABITS. Occurs wherever the ground is riddled with holes of mouse-hare colonies (*Ochotona*) on the dry fringes of bogs etc., in whose burrows it roosts and breeds. Has a habit of bobbing and bowing when it alights.

Display flight. While the female remains on the ground the male rises steeply in the air for some 10 or 15 m on outspread fluttering wings, like a lark, then suddenly nose-dives perpendicularly with a loud swishing of the wings, alighting close to the female to resume his courtship on the ground. His body is held horizontal, neck stretched in front, throat puffed and head bowed low as he circles round her with outspread tail (Schäfer).

FOOD. Insects, probably also seeds.

VOICE AND CALLS. Call-note *duid duid*. Alarm, a nasal finch-like note (Schäfer).

BREEDING. Extralimital.

MUSEUM DIAGNOSIS. See Field Characters and Key to the Species.

1954. Rednecked Snow Finch. *Montifringilla ruficollis* Blanford

Montifringilla ruficollis Blanford, 1871, Proc. Asiat. Soc. Bengal: 227

(Lachen Valley, N. Sikkim)

Baker, FBI No. 1113, Vol. 3: 189

Plate 94, fig. 16.

LOCAL NAMES. *Abyi*, *Rib-che-kar-po* (Tibetan).

SIZE. Sparrow \pm ; length c. 15 cm (6 in.).

FIELD CHARACTERS. Above, forehead and supercilium dingy white. A dark band through eye. Back of crown, ear-coverts and sides of neck rufous. Back pale brown with darker streaks. Wings brown with a white shoulder-patch and largely white secondaries. Central rectrices dark brown, outer rectrices grey, all with a broad white subterminal band and dark brown tips. Below, throat white, sides of lower throat rufous. A dark malar streak. Rest of underparts creamy white. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Recorded in northern Sikkim in October and December at c. 4200-4800 m (Mandelli, Meinertzhagen). A sight record in October near Darjeeling (JBNHS 60: 689). Affects open gravel plains, grassy plateaux and banks of streams.

Extralimital. Tibet north to Tsinghai and Sinkiang.

GENERAL HABITS. Keeps in pairs in the breeding season, otherwise in small flocks, sometimes with other species. Lives in company with mouse-hares (*Ochotona*) feeding around the mouths of their burrows. Has a display flight rather similar to that of Mandelli's Snow Finch (1953).

FOOD. Seeds and insects.

VOICE and CALLS. Call-note *diuid* and a magpie-like alarm-note, softer than that of *M. adamsi* (Schäfer).

BREEDING. Extralimital.

MUSEUM DIAGNOSIS. See Field Characters and Key to the Species.

86

PASSERINAE

FIELD CHARACTERS. Above, forehead white with a black horn-like mark; lores and a line through eye black. A white supercilium. Ear-coverts white. Crown ashy white changing to rufous on nape and sides of neck. Rest of upperparts fulvous brown. Wing as in *ruficollis* but without white shoulder-patch. Central rectrices brown, outer grey at base, then white with subterminal brown band and fulvous tips. Below, throat black, sides of breast rufous. Rest of underparts creamy white. Sexes alike.

Distinguished from *ruficollis* by black markings on face, white ear-coverts, unstreaked upperparts, lack of white shoulder-patch, and black throat.

STATUS, DISTRIBUTION and HABITAT. Recorded in northern Sikkim in September, October and December at c. 4200 m (Mandelli, Meinertzhagen), and 'near Darjiling' (Cat. Bds. Brit. Mus. 12: 264). Presumably also northern Ladakh in the Karakoram Range (cf. Sillem, 1935: 462). Affects Tibetan steppe country and cultivation near villages.

Extralimital. Tibet from the northern Himalayan ranges north to Tsinghai, west to north of Karakoram Pass.

GENERAL HABITS. Keeps in pairs in the breeding season, in large flocks in winter. Associates with mouse-hares (*Ochotona*). In winter feeds with sparrows near houses.

FOOD. Seeds and insects.

VOICE and CALLS. A rapid, twittering song uttered during display flight. Other notes unrecorded.

BREEDING. Extralimital.

MUSEUM DIAGNOSIS. See Field Characters and Key to the Species.

MEASUREMENTS

SIZE. Sparrow; length c. 15 cm (6 in.).

WEAVER BIRDS, BAYAS

89

FIELD CHARACTERS.

x c. 1

Male (breeding). Above, crown yellow. Rest of upperparts dark brown streaked with yellow on back. Below, throat and ear-coverts dark brown. Breast yellow. Rest of underparts cream-buff.

Female. Above, crown and back yellowish buff streaked with dark brown. Supercilium and sides of neck yellowish buff. Below, throat white, tinged with yellow. Breast yellowish buff with brown streaks on sides. Belly cream-buff.

Male (non-breeding). Similar to female but darker, more boldly streaked above; supercilium and breast very pale yellow rather than buff yellow.

STATUS, DISTRIBUTION and HABITAT. Common resident, subject to seasonal movements. Pakistan in Sind and Punjab east of the Jhelum river, and the whole of India (except for the range of *travancorensis*) east to eastern Bihar and Bengal (here intergrading with *burmanicus*); also Sri Lanka in all zones.

Ploceus philippinus

Distributional ranges

- 1 *philippinus* (1957). 2 *travancorensis* (1958).
3 *burmanicus* (1959). 4 extralimital subspecies.

In the Himalayas up to c. 1200 m (Kangra), 1400 m (Nepal Valley). In Sri Lanka up to c. 900 m. Affects open cultivation, often near paddyfields, grassland and secondary scrub dotted with babool trees and date and palmyra palms.

MIGRATION. In the Himalayas most migrate to lower levels in winter. Noted as absent from the plains of Madhya Pradesh in the non-breeding

WEAVER BIRDS, BAYAS

91

Nests hung along telephone wires or from the palm-leaf thatching of tenanted village huts are not uncommon in some parts of the country. A colony usually contains nests in all stages of construction, from the initial attachment or 'wad' through the various half-finished 'bell' or 'helmet' stages up to complete retorts with long entrance-tubes. Old nest colonies sometimes constitute a minor fire hazard in the dry season. During a forest fire the suspensions get quickly burnt through. In a strong wind the burning nests are liable to get blown away hundreds of metres across cleared firelines etc., like incendiary balloons, and spread the conflagration to otherwise safe parts of the forest. Eggs, usually 3, less often 2 and rarely 4; white, unmarked. Average size of 100 eggs. 20.3 x 14.5 mm (Baker). Incubation by female alone; period 14 to 15 days. Feeding of chicks by female though male occasionally helps. Chicks fly in 15-17 days.

x c. 1/10

First-year females mate and breed successfully, while first-year males do not assume nuptial plumage or breed till their second year. They may build nests in their first year in sites segregated from those of the adults; often these nests are somewhat aberrant or amateurish in form. The builders sing and advertise, but the nests are never accepted by females although they may occasionally be visited and inspected by them.

Highlights of the unique breeding biology of the Baya may be summarized as follows: The male practises successive polygyny. He alone builds the nest; the female takes no part in the work except in scantily lining the egg chamber after she has accepted the nest. In the early stages of a nesting colony the females are completely absent. When some of the nests have reached the 'helmet' stage (half-built) a party of females visits the colony to prospect for suitable nests. The birds hop from one 'helmet' to another perching on the initial ring or 'chin strap', pulling a strip here and another there, obviously examining the structure critically. All the while they are engaged in the scrutiny the owner males flutter excitedly, clinging outside the nest giving their wing-beating displays and warding off competing males. Some nests are approved by females, others rejected. Those that fail to find tenants are often cut down by the builders themselves, and successful nests, even when containing eggs, often by disgruntled rivals. Once a nest is approved by her, the female softens to the owner's advances and permits, and even invites, copulation by the impetuous suitor. The act takes place on the chin strap and seals the pair bond as it were. The male thereafter hurries to complete the egg chamber and complete the nest for her occupation. As soon as she is settled on the eggs he commences to build a second nest close by. This passes through the same vicissitudes and a second female may be duly installed. The male may then proceed to build a third nest, and in rare cases maybe a fourth (once even a fifth observed). In this way a single male

90

PLOCEINAE

season; absent from Bahawalpur in winter. In northern Gujarat, Jodhpur and near Bombay it is common in the breeding season but scarce (apparently) in winter. Has straggled to Quetta in summer. Movements largely controlled by rain and the incidence of rice cultivation.

GENERAL HABITS. Highly gregarious, keeping in flocks the year round and breeding in colonies. Flocking instinct so strong that at the end of the breeding season in almost every large nest colony may be found incubated eggs or even a mummified brood of nestlings abandoned in the parents' hurry to leave the colony with the rest of the community. Gleans grass- and weed seeds on scanty grassland and fallows, and on dusty cart tracks, harvested fields, etc. hopping like sparrow. Also raids ripening crops of jowar, maize, rice and other cereals, often causing considerable damage. However, this largely mitigated by its destruction of vast quantities of insect pests especially during the period of nest feeding. Roosts in swarms in swampy reed-beds and sugarcane fields etc. in company with mynas, and other birds—in winter commonly with wagtails and swallows. During breeding season nest-building males indulge in noisy singing choruses and lively wing-beating displays, thus advertising the colonies to the females from afar.

FOOD. Chiefly grass- and weed seeds (Panicaceae), cereal grains (rice, jowar, bajra, etc.), insects [grasshoppers (Orthoptera), beetles (Coleoptera), moths (Heterocera)], caterpillars and spiders; flower-nectar (e.g. of *Salicaria*, *Erythrina*, *Capparis*, etc.) whenever available. Nestlings fed mainly on caterpillars, moths, grasshoppers, spiders and triturated tender paddy grains. (For further particulars of food and feeding habits see D. N. Mathew, 1971, Ph.D. thesis, Bombay University, in press.)

VOICE and CALLS. Alarm-notes, a sparrow-like *chit-chit-chit* varying in tempo and vehemence with the occasion. Song, in breeding season, a softer *chit chit chit* followed by a long-drawn wheezy whistle *chee-ee-ee* uttered in chorus by males working in a nest colony. A less intense version of the same also given in non-breeding season by a group of males resting in shrubbery during the midday heat. (For further details see SA and Crook in references cited below.)

BREEDING. Season, overall April to October depending mainly on the SW. and NE. monsoon rains. Building activities commence with the first monsoon showers and the peak nesting periods vary in different parts of the country; in Sri Lanka March-April and August-September. Often two broods reared. Nest, pensile, retort-shaped, with a long down-hanging entrance tube measuring between c. 40 and 65 cm in length (once 90 cm +). Composed of finely woven strips of leaves of rice, sugarcane or coarse grass (sometimes of date or coconut), unlined, or only occasionally so with a few feathers or scanty vegetable down. Blobs of mud almost invariably stuck inside the 'dome', presumably for strengthening the fabric but whose real purpose remains equivocal. Nests grouped in colonies of maybe from a half dozen to over 200 on a single tree—commonly a palm (date, palmyra, coconut or other) and trees such as sheesham (*Dalbergia*), babool (*Acacia*), kandi (*Prosopis*), karanj (*Pongamia*) and others. Nests suspended from pinnae of palm fronds or tips of plant branches usually over water—pool, tank, canal, or village well; frequently on plants growing from sides of old wells—thus often from below ground level and up to maybe over 30 metres above it.

92

PLOCEINAE

may have two or three, and sometimes four, wives and families all more or less concurrently. N., 1971, Ph.D. thesis Bombay University, in press; Wood; Casey A., 1926, *The Auk* 43: 295-302.

MUSEUM DIAGNOSIS. See Field Characters and Key to the Subspecies. Post-nuptial moult complete. A partial spring moult to breeding plumage.

MEASUREMENTS	Wing	Bill (from skull)	Tarsus	Tail
♂♂	70-77	17-20	19-22	{ 43-52 mm 41-51 mm (HW, SA, BR)
♀♀	66-74			

Weight 7 ♂♂ 21-28 (av. 24.3); 10 ♀♀ 18-25 (av. 21.3) g—SA.
COLOURS OF DARE PARTS. Iris brown. Bill in breeding male very dark horny, in others horny brown with yellow on base and underside of lower mandible. Legs and feet horny brown, paler in female; claws light horny.

MISCELLANEOUS. Bayas are popular with bird fanciers and with itinerant entertainers at country fairs etc. They readily learn to perform a variety of clever tricks such as retrieving a ring thrown into a well before it touches water, threading tiny beads with a needle, plucking and bringing back leaves from a chosen tree to their master, and picking up the correct numbered card from among several spread before them. Many of the tricks require much skill and seeming intelligence, and the birds quite obviously enjoy performing them.

1958. *Travancore Baya*. *Ploceus philippinus travancorensis* Whistler
Ploceus philippinus travancorensis Whistler, 1936, J. Bombay nat. Hist. Soc. 38: 564
(Kottayam, Travancore)
Baker, FBI No. 1003 (part), Vol. 3: 67

LOCAL NAME. *Attakkūri* (Malayalam).

SIZE. Sparrow; length c. 15 cm (6 in.).

FIELD CHARACTERS. As in 1957, q.v.

STATUS, DISTRIBUTION and HABITAT. Common resident, subject to local movements. Southwestern India from about Goa (c. 16°N.) south through Kerala in the coastal low country, locally up to c. 1000 m. Affects open country in the neighbourhood of paddy cultivation.

GENERAL HABITS, FOOD and VOICE. As in 1957.

BREEDING. Season, mainly May to September during the SW. monsoon, but in some years when there is a good autumnal northeast monsoon a recrudescence of breeding activity takes place in October-November (Brett, JBNHS 50: 57). Season much prolonged in the coastal backwaters area of Kerala where breeding colonies have been found as early as February to April. Rice cultivation here is not wholly dependent on the monsoon and

Male (non-breeding), similar to female but with more blackish brown on breast.

Dark breast-band identifies the species. Females with buff breast distinguished from female Baya by brown and yellow pattern on sides of head.

STATUS, DISTRIBUTION and HABITAT. An endemic species. Resident, subject to local movements; common but locally and capriciously distributed. Pakistan and northern India from N.W.F.P. (Thal) east through Punjab, the Gangetic Plain, Bangladesh, Assam and Manipur; also Sind (Larkana, Hyderabad, Shikarpur), Kutch (vagrant), Gujarat (Deesa, Baroda and

Ploceus benghalensis

■ Distributional range

Kaira districts) and Bhandup near Bombay; one record from Bastar, south-eastern M.P. (SF 5: 418), and a winter record in the western Nepal terai (Rand & Fleming, 1957). Breeds in the duns of Uttar Pradesh and in Sikkim up to 1200 m (Baker, *Nidification* 3: 7), otherwise essentially a bird of the terai and plains. Affects reed swamps and grassy plains liable to monsoon flooding.

GENERAL HABITS. More or less as of Baya (1957) q.v. Keeps in flocks outside the breeding season.

FOOD. Seeds and insects.

VOICE and CALLS. Soft *chit-chit* calls given by birds flying into the colony. Song, a soft, barely audible *tsi tsi tsik tsik tsik* like the chirping of a cricket (or 'short, subdued squeaks as of an unrolled bicycle wheel'—SA) given during wing-beating display while male approaches female closely; also when sitting solitarily within his territory. Its function appears to be courtship rather than advertisement, although there may be some advertisement significance when the male sings by himself (Crook).

SIZE. Sparrow; length c. 15 cm (6 in.).

FIELD CHARACTERS. Male (breeding). Above, crown golden yellow. Sides of head dark brown. Rest of upperparts dark brown streaked with fulvous. Below, throat brown. Rest of underparts buff streaked with dark brown, especially on breast.

Female and non-breeding male. Above, dark brown with fulvous streaks. A conspicuous yellowish supercilium. Ear-coverts dark brown. A yellow patch on sides of neck. Below, throat and belly whitish. Breast and flanks buff streaked with dark brown. Confusingly like female *benghalensis*, but primrose yellow supercilium continued as a loop round brownish ear-coverts into a short collar on sides of neck usually diagnostic.

The boldly streaked breast identifies the species. Some lightly streaked non-breeding males very similar to the Baya but distinguished by yellow patch on sides of neck.

STATUS, DISTRIBUTION and HABITAT. Resident, widespread but locally distributed; common in suitable localities. Pakistan from Punjab and Sind east and south throughout the Indian Peninsula to Kerala and Sri Lanka,

Ploceus manyar

Distributional ranges

■ 1 *flavipectus* (1962).

■ 2 *peguensis* (1963).

■ 3 extralimital subspecies.

east to eastern Bihar and Bengal. Affects flat, swampy and rain-flooded land and riverbeds, especially bulrushes and reeds standing in water [while *P. benghalensis* tends to occupy grassland ('seat of thatching grass') and adjacent flooded ground].

GENERAL HABITS. Similar to those of the Baya. For details on behaviour, see Crook, J. H., JBNHS 60: 1-48.

FOOD. Grass- and weed-seeds and cereal grains (including rice), and insects.

BREEDING. Season, June to September, starting with the onset of the SW. monsoon. Nest, similar to Baya's (1957) but non-pensile, somewhat smaller, and with a shorter entrance-tube—seldom as long as 25 or 30 cm. Built in groups of twos and threes in a widely scattered colony among dense stands of grasses, especially moonj or kans (*Saccharum spontaneum*), bordering ponds,

× c. 1/10

canals, flooded ditches and borrow-pits, etc. in low-lying swampy country. Some of the growing stems are incorporated directly into the flat 'dome' or top of the structure and support it in position. At the 'helmet' stage of the construction a quantity of wet mud or cowdung (in one case human excreta—SA) is daubed thickly along the edge of the helmet—analogueous to the nape portion—into which bright-coloured scarlet or orange flowers or flower-petals (*Lantana*, *Legrostroemia*) are implanted. Observations suggest that this is part of the courtship rituals in the present species and *P. manyar* which may exercise a direct influence on the reactions of the visiting female. However, though frequent enough, this does not appear to be a universal habit.

A common form of display consists of the male alighting a few centimetres from the female on a more or less horizontal arching reed stem, bowing his head low so that his bluish bill points groundwards and his golden crown is presented at her, while he flaps his outspread wings deliberately but unhurriedly and moves closer. (For details on ecology, display, reproductive behaviour, etc., see Crook, J. H., JBNHS 60: 1-48; Ambedkar, V. C., *ibid.* 69: 268-82.

MUSEUM DIAGNOSIS. See Field Characters and Key to the Species.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail

Baker, FBI Nos. 1013, 1014, Vol. 3: 73, 74

Plate 100, fig. 12

LOCAL NAMES. *Titia bāyā* (U.P.); *Tit-bāyā* (Bengali); *Bāmāni bāyā* (Hindi in Deccan); *Attakkūri*, *Kiyatāta* (Malayalam); *Thūkanā kūri*, *Alenja kūri* (Tamil in Ceylon); *Wadu kurullā* (Sinhala).

VOICE and CALLS. Birds approaching the colony emit loud *chirt chirt chirt* calls continually. Displaying males call *tre tre cherr cherr* repeatedly when performing in unison with other males. Song, a soft continuous trill *see-ser-see-ser-see* (usually repeated about six times) culminating in a joyous long-drawn *o-cheeee* or *o-wheteez*. Given by males individually (not in chorus) while perched on dome of nest or nearby, with neck fully upstretched and without any wing-flapping. Of same pattern as the Baya's song but softer and more musical. A different song—a pleasant more spirited jingle *tili-tili-tili-tili*, *tili-tili-tili*... given when a female is sighted in the vicinity of his half-built nest. The working male flies excitedly from reed to reed (or over) his territory with slow deliberate (hovering) wing-flaps, legs dangling below, singing lustily in an obvious effort to entice her. If she flies off he gives chase for a few metres in the same hovering manner but soon loops back to his nest—the action reminiscent of a flycatcher's sortie after a gnat. He continues to sing upon regaining his perch to the accompaniment of vigorous wing-beating (SA).

BREEDING. Season, early July to September in the Peninsula; from February on in Kerala; February to April and June to October in Sri Lanka. Nest, a rather loosely woven structure of coarse grass strips like the Baya's, but smaller, rounder, comparatively roughly finished, and without the pensile suspension or the elongated entrance-tube (only occasionally up to 15 or 20 cm long). Attached directly to tips of several inwardly arching flags of bulrush (cat-tail) or coarse grass blades pulled in by the bird towards the 'wad' or point of suspension of the nest (something like the ribs of an open umbrella meeting at the centre) and worked into its dome and walls. Individual nests usually dispersed 2 or 3 metres apart over a wide area in small scattered colonies (c. clusters of 3 or 4 nests in *benghalensis*) among beds of

× c. 1/10

bulrushes (*Typha*) and sarpat grass (*Phragmites*) standing in water, the colonies often mixed with Blackthroated Weavers. Sometimes built at end of thin pliant branches of bushes and small trees overhanging streams or ponds. At the 'helmet' stage of the construction the interior of the nest (along the edge of the 'nape' portion, above the egg-chamber to be) is often plastered with blobs of wet mud or cowdung into which bright-coloured flowers (e.g. *Lantana*) or petals are commonly impressed; cf. Blackthroated Weaver (1961). Eggs, usually 3, sometimes 2 or 4, white. Average size of 50 eggs 20.3 × 14.3 mm (Baker). Incubation mainly by female, but male takes greater part in this chore than do others of the genus. Incubation period 14-17 days; care of young by both sexes; young fly in 17-18 days. As in the genus, male polygynous, but occasional monogyny has been observed, and also promiscuity in both sexes (SA). For other details on ecology, behaviour

LOCAL NAMES. *Lāl* or *Lāl mūnia* (Hindi, Bengali); *Torra-jinuweyi* (Telugu).

AVADAVAT, MUNIAS

103

FOOD. Chiefly grass seeds.

VOICE and CALLS. A series of high-pitched chirps uttered in flight (Fleming) and a 'husky squeak'. Song, a high-pitched but soft continuous twittering given by male from the tip of reed stalks; sometimes also in flight.

BREEDING. Season, in Assam mostly June to August, in northern India mostly July to October, in Pakistan mostly after the rains, September to December. Nests have also been found in May, January and February. Nest, a ball of grass with lateral entrance-hole — sometimes in the form of a short tube of flowering grasses. Lined with finer grass, floss from bulrush heads, etc. and occasionally a few feathers. Placed low down in a thorny bush often near ponds, streams and canals, occasionally in rushes standing in water. Eggs, 6 to 10, white. Average size of 100 eggs 14.4 × 11.2 mm (Baker). Building of nest by both sexes, the male often adding to the nest while the female is incubating.

MUSEUM DIAGNOSIS. See Field Characters. A complete moult to breeding plumage in May-July. Postjuvinal moult complete, about April.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂ ♂	47-50	9-11	12-13	35-40 mm
♀ ♀	47-50			34-39 mm (HW, SA)

COLOURS OF BARE PARTS. Iris hazel brown or brownish orange. Bill blackish brown in very young birds, changing to reddish brown; in adults or nearly grown birds bright coral-red, blackish on culmen; mouth in immature bird pale yellow with tiny slate coloured spots. Legs and feet brownish flesh or pinkish flesh colour; claws brown.

Miscellaneous. The Avadavat is a favourite cage bird, widely exported. Its name is believed to be a corruption of Ahmedabad (now the capital of Gujarat State), whence more than 200 years ago examples were brought to the English factory in Surat (JBNHS 36: 837).

1965. **Green Munia.** *Estrilda formosa* (Latham)

Distributional ranges

1 *E. amandava* (1964). 2 Extralimital subspecies.

Traylor, 1968); in Assam up to c. 1200 m. In the hills of southern India up to 1800 m, locally to 2100 m. Has a preference for swampy grassland and sugarcane fields. Affects reeds and tall grass near marshes, jheels and canals, mixed grass and dwarf *Zizyphus* or tamarisk scrub near cultivation, etc.; in Assam also villages, gardens and cultivation.

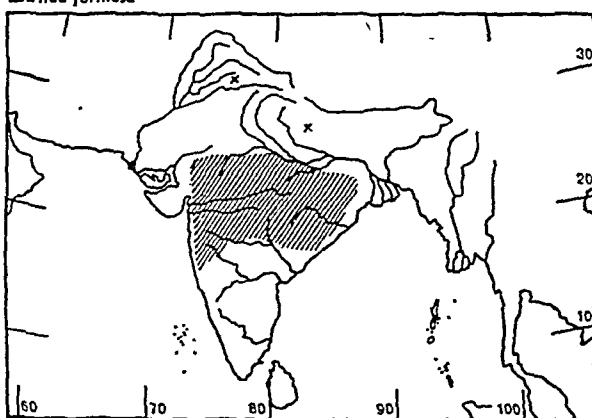

Extralimital. The species extends to Yunnan, the Indochinese countries, and the Lesser Sunda islands. Introduced in Sumatra, Singapore, Manila, Mauritius and Réunion islands.

GENERAL HABITS. Keeps in pairs or small flocks up to 30 birds, often with other munias, feeding on grass heads or on the ground and roosting communally in reed-beds and sugarcane fields.

104

ESTRILDINAE

and Vishakhapatnam Ghats. Also recorded from Lucknow (Reid, SF 10: 56) and Lahore (Currie, JBNHS 24: 566 and 594); specimens from

Estrilda formosa

1 Distributional range X Isolated pockets

'Bihar' (Hodgson) in the British Museum. Affects grass and low bushes, tall grassland, sugarcane fields, and boulder-strewn scrub jungle.

GENERAL HABITS. Feeds on the ground and flies up into grass and low bushes when disturbed. In the non-breeding season collects in closely knit flocks of up to 30 or 50 birds.

VOICE and CALLS. Keeps up a distinctive conversational *sweet sweet*... reminiscent of the squeaks of *Turdoides subrufus* (1259) only much feebler. Also feeble *cheeps* like Red Munia's (SA).

BREEDING. Season: breeding recorded in May and January. Nest, a large globular structure made exteriorly of coarse grass, lined with finer grass, and attached to sugarcane leaves. Breeds in small colonies. Eggs, 5 or 6, white. Average size of 16 eggs 17.2 × 11.9 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂ ♂	46-51	10-11	13-15	34-39 mm
♀ ♀	46-50			35-39 mm (HW, SA)

COLOURS OF BARE PARTS. Iris brown. Bill red. Legs and feet slaty brown to fleshy brown.

Genus *Lonchura* Sykes

Lonchura Sykes, 1832, Proc. Zool. Soc. London: 94.

Type, by original designation, *Fringilla nisoria* Temminck = *Loxia punctulata* Linnaeus
Mania Hodgson, 1836, Asiat. Res. 19: 153..

Type, by original designation, *M. rubroniger* Hodgson = *Loxia atricapilla* Vieillot
Uroloncha Cabanis, 1851, Mus.-Hein. 1: 173, new name for *Lonchura* Sykes

Wing rather pointed. Tail short or moderate. Bill stout, swollen at base. Legs rather short, toes long.

LOCAL NAMES. *Pācāi mūnia* (Gujarati); *Chōrchārā, Chārgā, Chārakkā, Piddā* (Hindi); *Pidūri, Sar mūnia* (Bengali); *Jinucayi* (Telugu); *Vayalatta* (Malayalam); *Nellā-kūrūci* (Tamil in Ceylon); *Wee-kurullā* (Sinhala).

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. A plain earthy brown thick-billed little bird with a pointed blackish tail, whitish underparts and a white rump. Above, brown. Rump white; wings and tail dark brown, the latter pointed. Below, creamy white; flanks brownish buff. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Common and widespread resident. Pakistan from Chitral, Quetta and Karachi east and south throughout India to Bangladesh (Dacca); also Sri Lanka in the low-country Dry zone. In Chitral (where it is a summer visitor), in Punjab and at Mussooree occurs up to c. 1200 m; in Nepal only recorded from the eastern terai; in India restricted to the low country up to 600 m. Affects cultivation, grass-land, babool jungle, sparsely scrubbed country and light secondary jungle. Prefers drier country than other munias.

Extralimital. Ranges west to southern Arabia. Other subspecies in Africa south to Tanzania.

GENERAL HABITS. Those of the genus. Usually in flocks, up to 60 birds. Feeds on the ground, often by hedges and along cross-country cart tracks. Drinks by rapid 'sip and swallow' action at the rate of about two per second. Roosts in family parties of 5 or 6 huddled together in old nests.

size of 100 eggs 15.7 × 11.7 mm (Baker). Incubation probably by both sexes; both owners occupy the nest at night while incubating or brooding. Self-built as well as appropriated Baya nests are habitually used as dormitories when breeding is over.

MUSEUM DIAGNOSIS. See Field Characters. Young like adult but upper tail-coverts and rump mottled with brown; central rectrices not elongated.

Baker, FBI No. 1024, Vol. 3: 84

LOCAL NAMES. *Shākdri mūnia, Kūtis* (Hindi, Bengali); *Samprek-pho* (Lepcha); *Namprek* (Bhutanese); *Dao-muni* (Cachari).

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. As in 1968 but belly greyish white, finely streaked.

STATUS, DISTRIBUTION AND HABITAT. Resident, subject to seasonal movement; uncommon except in Assam where locally abundant. The Himalayan foothills from Garhwal east through Nepal, Sikkim, Darjeeling and Jalpaiguri districts, Bhutan, Arunachal Pradesh; Assam, Nagaland, Manipur and Bangladesh. From the base of the hills up to c. 1500 m, locally 1800 m (Sikkim); in Assam most numerous between 400 and 1000 m. A summer visitor to the Nepal Valley. Occurs to c. 1200 m in winter. Affects open country, light scrub-jungle and secondary growth.

Extralimital. Ranges east to Burma and northern Thailand. The species extends through the Indochinese countries and southern China to Taiwan, south to Sumatra.

GENERAL HABITS, FOOD AND VOICE. As in 1968.

BREEDING. Season, chiefly from mid May to end August, but eggs may be found in almost every month. Nest and eggs as in 1968. For details see *Nidification* 3: 19. Average size of 100 eggs 15.3 × 10.9 mm (Baker).

Lonchura malabarica

Distributional ranges

■ *malabarica* (1966).

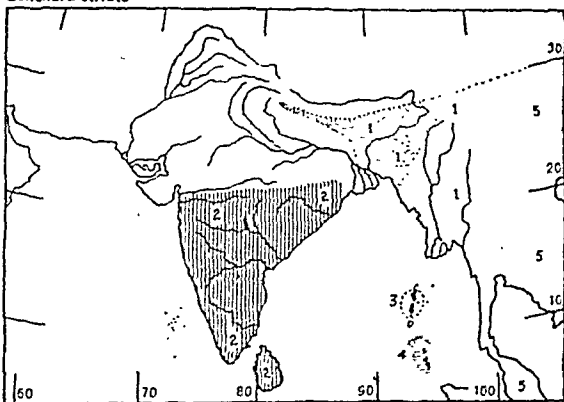

▨ Extralimital subspecies.

FOOD. Seeds of grasses such as *Pennisetum*, sorghum, *Saccharum*, sedges, etc.; also ants, beetles and other small insects. Occasionally flower-nectar (*Erythrina*) — SA.

VOICE AND CALLS. 'A twittering cheeping, a plaintive little whistle, a sharp chip and a triple chirp' (Nichols).

BREEDING. Season, chiefly July to December in Punjab, January to March in central India, September to November about Hyderabad, December to May in Kerala, December to March in Sri Lanka. Nest, an untidy ball of grass with a lateral entrance-hole distinctively fringed, like a short tube, with feathery flowering grasses. Similar to nest of Striated Munia but with fine twigs on the exterior; often lined with a variety of feathers (egret, parakeet, roller, etc.) and in cotton-growing areas with cotton wool filched from the fields. In one case many bits of newspaper were used on the outside. Nest placed in some thorny bush (*Zizyphus, Acacia, Capparis, Euphorbia*, etc.) usually about two or three metres above the ground. Nests have frequently been found within the pile of sticks forming the nest of a vulture or eagle, even an occupied one, and in the thatch of houses. Disused Baya nests are often appropriated; the birds may often be seen haunting Baya nest-colonies even while the legitimate owners are still in occupation, entering the hanging tubes as opportunity offers. Although the munias' eggs have never been found in occupied Baya nests, it has been suggested that this behaviour may show how parasitism originated among some of the African Ploceinae. On one occasion, however, munias' eggs were found in a House Sparrow's nest in addition to the sparrow's own. Eggs, 4 to 8, white; as many as 25 have been found in a single nest, the product of several females. Average

Lonchura striata

Distributional ranges

1 *acuticauda* (1967). 2 *striata* (1968). 3 *fumigata* (1969).

4 *semistriata* (1970). 5 Extralimital subspecies.

MUSEUM DIAGNOSIS. Differs from *striata* (1968) in having the belly finely streaked. For details of plumage see Baker, loc. cit.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail

Plate 98, fig. 19

LOCAL NAMES. *Attakkārāppān* (Malayalam); *Nellā kūrūci, Tinayar, Tisei-kūrūci* (Tamil in Ceylon); *Wee-kurullā* (Sinhala).

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. A small brown-and-white finch with a heavy bluish conical bill and pointed tail. Above, forehead, wings and tail blackish brown.

AVADAVAT, MUNIAS

109

Tail, x c. 1

Back brown with very fine pale shaft-streaks; rump white. *Below*, throat and breast blackish brown; belly creamy white. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Common resident, subject to local movements. The Indian Peninsula from southern Bihar (Manbhum), southern Madhya Pradesh (Seoni, Betul) and southeastern Gujarat (Surat Dangs—Sálim Ali, JBNHS 52: 794) south through Kerala and Tamil Nadu; in the low country and hills up to c. 900 m, in southern India sparingly up to 1800 m. Also Sri Lanka in the low country; the drier side of hills up to c. 1500 m. Affects

scrub and lightly wooded country about cultivation, deciduous jungle, cultivation and gardens.

GENERAL HABITS. Typical of the munias. Usually keeps in small flocks of 8 to 15 birds, when not breeding; sometimes of considerable size when they may do local damage to cereal crops. Gleans on the ground, often along roadsides and in paddy stubbles; or it methodically clammers up grass stems bending them down to the ground with its weight and plucks the seeds from the panicles. Roosts communally with Spotted Munias and weaver birds in lantana thickets, sugarcane fields, etc.

FOOD. Seeds of grass, bamboo, etc. Insects are fed to nestlings. Reported feeding on a green alga (*Spirogyra* sp.) (Pillai, JBNHS 65: 490).

VOICE and CALLS. A quiet twittering varying in pitch and modulation, given in groups. A plaintive peeping call.

BREEDING. *Season*, mostly during the rains, but nests may be found in almost every month: in Maharashtra chiefly March to November, most eggs being laid in August–September; in the south more ill-defined, July to December, but mainly after the monsoon. *Nest*, a small, roughly built ball of coarse, broad-leaved grass or bamboo leaves, lined with finer grass whose flowering heads project round the entrance-hole like a short tube; placed in a small tree, among the upper or outer twigs, between two and six metres above the ground, usually under 4 metres. *Eggs* 3 to 8, most often 5, white. Average size of 100 eggs 15.3 × 10.7 mm (Baker). Two females may lay in the same nest, and it is common to find two birds incubating together. Building by both sexes. Incubation by both sexes; period 13–14 days from laying of the last egg. Both parents feed the young, apparently largely by regurgitation. Excreta are not removed, thus the nest soon becomes foul. Both sexes use the nest for roosting from the time it is completed, and later the whole family may roost in it for some weeks.

MUSEUM DIAGNOSIS. Differs from *acuticauda* (1967) in having unstreaked, creamy white belly. Young, like adults but dark brown of throat with paler fringes, giving a scaly appearance.

MEASUREMENTS

LONCHURA KELAARTI (Jerdon)

Key to the Subspecies

Rump spotted with white.....	<i>L. k. kelaarti</i>
Rump not spotted.....	<i>L. k. jerdoni</i>

112

ESTRILDINAE

GENERAL HABITS. Those of the genus. Frequently consorts in mixed flocks with *L. striata*.

FOOD. Mainly grass- and weed-seeds, and rice.

VOICE and CALLS. A high-pitched nasal squeak.

BREEDING. *Season*, April to August. *Nest*, indistinguishable from that of *L. striata* and built in similar situations; also placed in the eaves of thatched houses, or in recesses or large cavities in tree-trunks. *Eggs*, 6 to 8, white. Average size of 36 eggs 16 × 11.5 mm (Baker). Nests are apparently sometimes built for roosting purposes as groups of eight to ten birds have been flushed out of nests which showed no sign of having been used for breeding. For further details see 1973.

MUSEUM DIAGNOSIS. Adult summer plumage differs from *kelaarti* as follows: rump similar to back, upper tail-coverts less black, more approaching the colour of rump, the markings pinkish and nearly obsolete. Underparts below black gular patch pinkish buff with pale shaft-streaks, the markings confined to a small area on the vent; under tail-coverts with pinkish buff shaft-streaks.

Immature plumage differs from corresponding stage of *kelaarti* in that the chin and throat lack the black and white spangles and resemble the remainder of the lower plumage, which lacks the dark broken cross-barring of *kelaarti*.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	56–59	13–14	14–15	37–43 mm
♀♀	57–59			36–39 mm (HW, SA)

Weight 15 ♂♀ 9.5–17 (av. 14.1) g—SA.

COLOURS OF BARE PARTS. Iris brown. Bill dark horny brown, bluish at chin and base of lower mandible; mouth slate with pale yellow crescent and patches on palate. Legs and feet greenish plumbeous; claws horny brown.

1973. **Ceylon Hill Munia.** *Lonchura kelaarti kelaarti* (Jerdon)

M. (unia) kelaarti 'Blyth' = Jerdon ex Blyth MS., 1863, *Bds. India* 2: 356 (Ceylon)

Baker, FBI No. 1029, Vol. 3: 89
Plate 98, fig. 16

LOCAL NAMES. *Wee kūrillā* (Sinhala); *Nēlla kūrūci* (Tamil in Ceylon).

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. *Above*, forehead, wings and tail blackish brown. Back brown with pale shaft-streaks. Rump dark brown with white spots. *Below*, throat and upper breast blackish brown. Sides of breast and neck pinkish fawn. Rest of underparts spangled white and dark brown. Sexes alike.

Young. *Above*, dark brown without shaft-streaks. *Below*, throat finely barred white and dark brown. Rest of underparts rufous brown spotted with buff.

STATUS, DISTRIBUTION and HABITAT. Common resident. Sri Lanka in the hills from c. 600 m to over 2100 m, occasionally down to c. 200 m in the Wet zone. Affects tea plantations, gardens, forest, and grass and lantana scrub.

GENERAL HABITS. Usually in pairs or small family parties, travelling about more than other munias, often flying at considerable heights. Often seen in company with *L. striata* or *L. punctulata*.

AVADAVAT, MUNIAS

113

FOOD. Grass- and weed-seeds and grain.

VOICE and CALLS. The call-note is the usual munia type of reedy chirp, but a funny little song of five notes is uttered at times 'audible only at short range' (Henry).

BREEDING. Season, starts in February as soon as the northeast monsoon slackens, reaches its peak in April and May; by June most young have flown. Nest-building recommences early in August after the winds and rains of the southwest monsoon have abated; peak of autumn breeding is in September. But nests have been found every month. Nest, a spherical or elliptical ball of green moss, maidenhair fern, fine grass or other material; often smaller, more compact and better finished than that of either the Spotted or the Whitebacked Munia. Placed in saplings, bushes, clumps of *Loranthus*, occasionally in large holes or recesses in trunks of dead or semi-decayed trees; generally between two and five metres above the ground, sometimes lower or as high as 18 metres. Eggs, 3 to 7, usually 5, white. Average size of 60 eggs 15.8 × 11.3 mm (Baker). Both birds build the nest, often one sits in the nest, receiving the materials and placing them in position while the other, generally the male, collects and brings them in with great rapidity. Building takes about six days. Incubation by both sexes; period 16 days from laying of last egg. Care of nestlings by both parents. Young leave nest between the 15th and 17th day after hatching; thereafter, the whole family return to the nest for several weeks to roost at night (Phillips, *Ceylon Jour. Sci.* 23: 184-6).

MUSEUM DIAGNOSIS. See Key to the Subspecies and Field Characters.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	54-58	c. 14	c. 14	38-42 mm
♀♀	54-58			36-42 mm
				(SDR, HW)

Weight 1 ♂ 12 g (SDR).

COLOURS OF BARE PARTS. Adult. Iris dark brown. Bill: upper mandible black, lower dark grey, bluish grey or grey, silvery grey at base. Legs and feet dull plumbeous, dark grey or olivaceous slate. Young. Bill black; gape yellow. Legs and feet yellowish grey-brown.

SIZE. Sparrow —; length c. 10 cm (4 in.).

AVADAVAT, MUNIAS

115

FOOD. Grass seeds, rice, lantana berries, etc.

VOICE and CALLS. Call-notes rendered as a petulant *kitty-kitty-kitty* and a short, rather husky whistle. Song, 'a remarkable performance: raising its head-feathers and standing very erect, it [the male] pours out its soul in ecstatic melody, with quivering throat and oscillating beak; but, to human ears at least, not a sound is audible!' (Henry).

BREEDING. Season, chiefly during the monsoon, May to September, beginning earlier in the south; odd nests may be found in any month. In the hills of Sri Lanka breeds in January-February until May with a peak period in March, and from July to December with a peak in October-November. In the Dry zone nesting very irregular: mostly April-May and again October to January. Several broods are reared (Phillips). Nest, globular, with a lateral entrance-hole; rather large for the size of the bird, made mostly of coarse grass and lined with finer grass and feathers. Generally placed in bushes or saplings between two and five metres above the ground; in certain areas commonly among the bases of palmyra (*Borassus*) fronds up to maybe 20 metres. Creepers growing on the trellis-work of verandas of upcountry bungalows is a favourite site. Eggs 4 to 10, usually 5 to 7 (in Sri Lanka normally 5), white. Average size of 100 eggs 16.4 × 11.6 mm (Baker). Building of nest by both sexes. Both birds incubate and roost in the nest at night; incubation period about 16 days. Care of young by both parents. For details of breeding see Phillips, 1948, *Ceylon Jour. Sci.* 23: 188-90.

MUSEUM DIAGNOSIS. See Field Characters and Key to the Subspecies. In the cold weather most birds are in plain brown dress. Molt into speckled plumage commences about March. By July-August, when the breeding season is at its peak, the majority of adults have attained the chestnut and speckled phase. Postjuvinal molt complete.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail

2 *subundulata* (1975).

3 Extralimital subspecies.

Lanka. In the Himalayas occurs generally up to c. 1800 m, occasionally higher (2400 m in Simla, 2300 m in Bhutan); common all year in Nepal Valley. In southern India does not usually ascend the hills (Sālim Ali, JBNHS 38: 508) but in the Nilgiris occurs up to c. 2100 m from June to October, leaving the higher levels in the cold weather. In Sri Lanka occurs up to c. 1500 m. Affects open country with scrub and trees, bush-clad hill-sides, secondary jungle with patches of grassland, gardens and cultivation.

GENERAL HABITS. Those of the genus. In the non-breeding season usually in flocks, sometimes up to 100 birds or more. Feeds on the ground or the stems of rice or grass; when disturbed flies up into trees or bushes uttering feeble twittering chirrups. The flocks fly in loose undulating ripples. Large congregations roost in lantana thickets, sugarcane fields, etc. in company with other munias and weaver birds.

116

ESTRILDINAE

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. As in 1974, q.v.

STATUS, DISTRIBUTION and HABITAT. Common resident. Assam and Bangladesh (intergrading with *punctulata* in western Bhutan) in the plains and hills up to c. 1800 m. Habitat as in 1974.

Extralimital. Burma. The species extends through southern China to Taiwan, the Philippines, Celebes and Sunda Islands. Introduced in Australia, Mauritius, Réunion, Seychelles, and Kauai (Hawaii).

GENERAL HABITS, FOOD and VOICE. As in 1974.

BREEDING. Season, chiefly May to September. Nest and eggs, as in 1974.

MUSEUM DIAGNOSIS. Like *punctulata* (1974) but rump more olive-grey, less barred; upper tail-coverts not so bright, more olive. Upperparts browner, not so rufous. White on underparts less pure so that scalloping is less well defined. Under tail-coverts often more mottled.

MEASUREMENTS and COLOURS OF BARE PARTS. As in 1974.

Weight 1 ♂, 2 ♀♀ 12-13 g (SDR). 1 ♂ (Nov.) 14 g — SA.

2 Upper tail-coverts maroon..... <i>L. m. rubroniger</i>	116

1976. Nepal Blackheaded Munia. *Longchura malacca rubroniger* (Hodgson)

M. (unia) Rubroniger Hodgson, 1836, Asiat. Res. 19: 153 (Nepal)

Baker, FBI No. 1020 (part), Vol. 3: 81

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. As in 1977, q.v.

STATUS, DISTRIBUTION and HABITAT. Resident, locally distributed. The Himalayan duns and terai, and plains of Uttar Pradesh and Bihar from about Jagadhri (c. 30°N, 77°E., Ambala dist.) east to eastern Nepal, south to Lucknow and Patna. In Nepal up to the Kathmandu Valley. Affects cultivation, tall grass and swampy ground.

GENERAL HABITS, FOOD and VOICE. As in 1978.

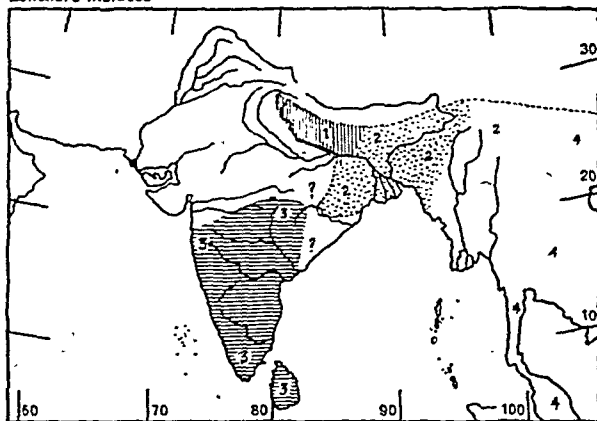

BREEDING. Season, July to September. Nest and eggs, undescribed; doubtless as in 1978.

MUSEUM DIAGNOSIS. See Key to the Subspecies. Differs from *atricapilla* (1977) in having the upper tail-coverts and edges of rectrices rich maroon, differing little on the rump, whereas in *atricapilla* these feathers are golden yellow to orange; rectrices deep reddish brown; upperparts slightly paler. Does not differ from *atricapilla* in wing-length or colour of underparts. (Cf. Parkes, K. C., 1958, Proc. U.S. Nat. Mus. 108: 279-93.)

MEASUREMENTS and COLOURS OF BARE PARTS. As in 1977.

Loxia atricapilla Vieillot, 1807, Hist. nat. ois. chanteurs: 84, pl. 53
(‘Les Grandes-Indes’, restricted to Lower Bengal by Robinson & Kloss, 1924, Jour. Nat. Hist. Soc. Siam 5: 362)
Baker, FBI No. 1020 (part), Vol. 3: 81
Plate 98, fig. 11

LOCAL NAMES. *Nakalnür* (Bengali); *Ushuk* (Manipur).

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. Above, head black; rest of upperparts rufous-chestnut, rump darker chestnut. Below, throat and breast black. Upper belly and sides chestnut; centre of belly and under tail-coverts black. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Resident, locally common. Assam, Manipur and Bangladesh west to eastern Nepal, intergrading here with *rubroniger* (cf. Fleming & Traylor, 1964: 551 and 1968: 188), eastern and southern Bihar (Lohardaga — Ball, SF 7: 222) and northern Orissa (Sambalpur — Hume collection). Affects cultivation, swamps and grass fields.

Extralimital. Extends to northwestern Yunnan. The species ranges east through southern China to Taiwan and the Philippines, and south through Indonesia.

GENERAL HABITS, FOOD and VOICE. As in 1978.

BREEDING. Season, May to November, mostly June to September. Nest and eggs, as in 1978. Average size of 60 eggs 16.3 × 11.5 mm (Baker).

AVADAVAT, MUNIAS

119

GENERAL HABITS. Essentially a marshland-haunting munia and a frequent associate of *Ploceus manyar* in the breeding season in south India. ‘As soon as the weavers arrive and start breeding, one or two pairs of munias take to haunting each group of nests, hopping about among their larger relatives and even settling on the nests themselves. As the weavers increase in numbers so do the munias. However they do not associate with the weavers while feeding’ (Betts). In the non-breeding season keeps in flocks of up to 100 or more individuals, sometimes in company with the Spotted Munia. Feeds on the ground, flying in undulating ripples up into tree-tops when disturbed, soon descending again in twos and threes to resume feeding.

FOOD. Grass seeds and rice.

VOICE and CALLS. Flight-call a triple chirp; another note is ‘a mild plaintive little ink’ (Nichols).

BREEDING. Season, chiefly in the rains, June to September; in south India nests may be found until December and in March, April and May. In Sri Lanka, season ill-defined; in the hills mostly May and August, in the low country almost any month. Nest, a large loose ball of coarse grass or cat’s-tail leaves lined with fine grass; flowering grass-heads project in a short trumpet-like tube all round the lateral entrance. Generally built in reeds or cat’s-tails, standing in water, bushes in marshy areas, or sugarcane, within a couple of metres of the ground or water, usually rather low down. Breeds in small colonies, often with the Streaked Weaver Bird, though nests are usually scattered over a wider area (Betts). Eggs, 5 or sometimes 6, white. Average size of 50 eggs 16.3 × 11.5 mm (Baker). Building, incubation and care of young by both parents.

MUSEUM DIAGNOSIS. See Key to the Subspecies. Young has the lower parts pale buff and rest of plumage rufous-brown.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	55–59	13–14	c. 16	32–39 mm
♀♀	53–56			31–36 mm (HW)

Weight 13 ♂♀ 10–15 (av. 13.3) g — SA.

COLOURS OF BARE PARTS. Iris brown. Bill pale bluish grey, dusky on culmen; mouth cream-colour with slaty crescent and blotches. Legs and feet slate; claws horny brown.

Genus *PADDA* Reichenbach

Padda Reichenbach, 1850, Av. Syst. Nat., pl. 76, fig. 6.

Type, by monotypy, *Loxia erythrura* Linnaeus

Bill large, both mandibles slightly convex. Legs strong. Wing rather pointed. First primary (as.) minute. Tail rounded.

1978a. Java Sparrow. *Padda erythrura* (Linnaeus)

Lonchura ferruginosa bakeri Delacour, 1943, Zoologica (New York) 28: 84. New name for *Munia malacca orientalis* Baker, 1925, preoccupied by *Lonchura malabarica orientalis* (Lorenz & Hellmayr), 1901; also by *Loxia orientalis* Forster, 1795 = *Lonchura p. punctulata* (Linnaeus)

Baker, FBI Nos. 1017 and 1018, Vol. 3: 78, 79

Plate 98, fig. 12

LOCAL NAMES. *Nakalnür*, *Tilia münia*, *Sing-báz*, *Pora münia*, *Nukroul* (Hindi); *Nalla jinacayi* (Telugu); *Attachemban* (Malayalam); *Thinai kūrūri* (Tamil, Madurai); *Nellukūrūri* (Tamil, Ceylon); *Wee-kūrūllā* (Sinhala).

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. Above, head black. Rest of upperparts rufous-chestnut, rump darker. Below, throat, breast, centre of belly, under tail-coverts and thighs black. Rest of underparts white. Sexes alike.

× c. 1

Tail, × c. 1

STATUS, DISTRIBUTION and HABITAT. Resident; locally common, with some monsoon-dependent local movements. The Indian Peninsula from Raipur¹, Pachmarhi and Bombay (JBNHS 62: 559–60) south to Kanyakumari and Sri Lanka, in the plains and lower hills up to c. 2100 m (southern India) or 1800 m (Sri Lanka). Affects marshland, reed-beds, grass fields and neighbourhood of flooded paddy cultivation in forest clearings.

¹ No intergrades seem to be known between this subspecies and *atricapilla* which occurs as far south as Sambalpur (c. 21°30'N.) some 250 km east of Raipur (see map p. 117). Further investigation in this area would be desirable. Orniston's 1906 record at Port Blair (JBNHS 17: 160) presumably refers to escapes or introduced birds. No subsequent record from the Andamans.

FRINGILLINAE

120

FIELD CHARACTERS. An unmistakable large-billed grey bird with black crown and white cheeks. Above, crown black, sides of head white; back ashy grey; tail black. Below, upper throat black; breast ashy; belly vinaceous; under tail-coverts white. Massive pink bill. Sexes alike.

Young. Above, mouse-grey, wings and tail darker. Below, buffish, greyer on breast.

STATUS, DISTRIBUTION and HABITAT. Introduced; resident. A colony established in Colombo before 1870, still surviving (Phillips, 1966). Also found around Calcutta where a colony was recorded in 1931 (Law, S. C., 1932, JBNHS 35: 683–5). ‘Appears to be acclimatized near Madras’ (Wait, 1931). Affects paddyfields, gardens and reed-beds. Uncommon and very local. Apparently not spreading significantly.

Extralimital. Java and Bali. A favourite cage-bird introduced or escaped in many areas.

GENERAL HABITS. ‘Very recently I had under observation a colony of these munias whose favourite resort is a shrubby situation composed of two or three trees embracing each other and overhanging the paddy stacks put up in the compound of some villagers. Their feeding ground in the early morning is the surrounding paddy-fields, where flocks of considerable size will feed on fallen paddy. They feed here till about 8 o'clock when they retire to their cover and roost, returning towards afternoon’ (Law, 1932).

FOOD. Rice and other seeds.

VOICE and CALLS. Utters constant chirrups.

BREEDING. Not described in our territory. In Java nests under roofs of buildings or high up in trees or palms. Eggs white.

MUSEUM DIAGNOSIS. See Field Characters.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♀	66–69	17–18	18–19	46–47 mm (Law)

COLOURS OF BARE PARTS. Male, adult: Iris reddish; orbital skin pink. Bill wine-red at base, pinkish white at tip. Legs and feet pinkish flesh. Young male: Iris brownish grey; orbital skin greyish pink. Bill fleshy pink washed with dusky. Legs and feet greyish flesh.

Family FRINGILLIDAE: Finches

(Europa = Sweden)

Baker, FBI No. 1092, Vol. 3: 163

Plate 101, fig. 1

LOCAL NAMES. None recorded.

SIZE. Sparrow; length c. 15 cm (6 in.).

FIELD CHARACTERS. Male. Above, forehead black; crown and nape blue-grey. Back brown; rump greenish. Tail blackish with white outer rectrices. Two broad white wing-bars. Below, pinkish brown. Male in winter is duller above, grey of crown obscured by brown margins to the feathers. Female. Above, brown. Two broad white wing-bars. Sides of head to breast pale brown grading to whitish on belly.

Easily distinguished from Brambling (1980), in somewhat similar winter plumage, by greenish rump (v. white).

STATUS, DISTRIBUTION AND HABITAT. Occasional winter visitor in extreme northwestern Pakistan from November to March: Kohat (Whitehead, *Ibis* 1909: 231 and JBNHS 18: 190) and Gilgit, 1500 m (Mountfort, 1971, *Ibis*: 109). Also observed in adjacent parts of Afghanistan (JBNHS 42: 439). Affects orchards.

Extralimital. Ranges from western Siberia (c. 85°E.) to western Europe with subspecies in Atlantic and Mediterranean islands, northwestern Africa, northern Iran and Transcaisia. Partly migratory.

GENERAL HABITS. In winter usually seen in flocks, sometimes in company with other finches or buntings. Feeds on the ground in the vicinity of trees. FOOD. In winter chiefly seeds.

VOICE AND CALLS. Call-note often uttered in flight, *yup*.

MUSEUM DIAGNOSIS. See Field Characters. For details of plumage see Baker, loc. cit.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
7 ♂♂	87-92	13-14	17-19	63-68 mm (Witherby)

COLOURS OF BARE PARTS. Iris hazel. Bill fleshy brown or fleshy grey to slaty blue. Legs and feet fleshy brown, pale horny brown to brown (Baker).

GOLDFINCHES AND ALLIES

1981. Hawfinch. *Coccothraustes coccothraustes humii* Sharpe

Coccothraustes humii Sharpe, 1886, Proc. Zool. Soc. London: 97

(Attock, NW. Punjab)

Baker, FBI No. 1038, Vol. 3: 100

Plate 103, fig. 8

LOCAL NAMES. None recorded.

SIZE. Sparrow; length c. 18 cm (7 in.).

FIELD CHARACTERS. Above, head and back tawny brown, with a broad ashy collar on hindneck. Loes and a narrow band at base of bill black. Wings black with a large white shoulder-patch and a concealed white patch

× c. 1

showing in flight. Tips of secondaries purple-black with a peculiar sinuous shape. Upper tail-coverts fulvous buff. Tail blackish with wide white terminal band. Below, throat black with narrow white surrounding line. Breast and flanks tawny brown, paler than back; centre of belly white. Sexes more or less alike; female's head more ashy.

STATUS, DISTRIBUTION AND HABITAT. Uncommon and local winter visitor in irregular numbers.¹ Pakistan in N.W.F.P. (Chitral, Kohat) east to Abbottabad, Rawalpindi, Jhelum Salt Range, Domel (Kashmir, A. E. Ward; specimen in U.S. Nat. Mus.) and south to northern Baluchistan (Fort Sandeman, Quetta), mostly in the foothills. Affects groves, orchards, gardens and wooded hills.

Extralimital. Breeds in eastern Kazakhstan, Kirghizistan, Tadzhikistan and western Afghanistan (Peters's Check-list). The species ranges west to Morocco and the British Isles, and east to the Ussuri region and Japan.

MIGRATION. Arrives in winter quarters in October-December, remains till the middle of April. Some birds recorded as late as 5 May in Kohat, c. 2700 m (Whitehead, *Ibis* 1909: 227) and in the second week of May in Chitral (Fulton, JBNHS 16: 52).

GENERAL HABITS. Usually seen in small scattered flocks of three to six individuals but sometimes up to 30 birds. Remains in flocks till the end of May. An erratic species. Feeds on the ground.

FOOD. Berries, seed, kernels of fruit stones. VOICE AND CALLS. A rather prolonged *zitt* or a shrill *tee* uttered in flight. Another note is rendered as *pit-zee* (Jones).

BREEDING. Extralimital. Season, June and July in Turkestan. Nest, placed in trees, 2-6 metres above ground.

¹ There are no breeding records nor any observations later than May.

122

CARDUELINAE

1980. Brambling. *Fringilla montifringilla* Linnaeus
Fringilla Montifringilla Linnaeus, 1758, Syst. Nat., ed. 10, 1: 179

(Europa = Sweden)

Baker, FBI No. 1093, Vol. 3: 164

Plate 101, fig. 2

LOCAL NAMES. None recorded.

SIZE. Sparrow; length c. 15 cm (6 in.).

FIELD CHARACTERS. Male (winter). Above, mottled rufous brown and black, with conspicuous white rump. Rufous wing-bars. Below, throat and breast rufous; flanks rufous with dark spots; belly white. Male in summer has distinctive black head and back.

× c. 1

Female. Above, mottled dark brown with white rump and some rufous and white on wings. Below, like male but duller.

Both sexes easily identified by white rump.

STATUS, DISTRIBUTION AND HABITAT. Winter visitor and passage migrant, fairly common locally: northern Baluchistan, N.W.F.P., Gilgit and Kashmir, straggling as far east as Simla and Mussooree (JBNHS 32: 727); from November to March or April. Affects gardens and orchards.

Extralimital. Breeds in northern Eurasia from Scandinavia to Kamchatka, south to central Russia, the Altai and Transbaicalia. In winter south to the Mediterranean, Iran, Turkestan, Yunnan, Fukien and Taiwan.

GENERAL HABITS. In winter usually keeps in large flocks, often in company with other finches and buntings. Feeds on the ground in the vicinity of trees. Flight undulating.

FOOD. In winter mostly seeds.

VOICE AND CALLS. Common call-note, a long (c. 1/2 second) wheezy, rather metallic whistle *sweetee*, or *beez* (reminiscent of goldfinch's) repeated monotonously at 3 to 5 seconds' intervals, in flight or from perch (SA).

MUSEUM DIAGNOSIS. See Field Characters. For details of plumage see Baker, loc. cit.

MEASUREMENTS

1982. Black-and-Yellow Grosbeak. *Mycerobas icteroides* (Vigors)

Coccothraustes icteroides Vigors, 1831, Proc. Zool. Soc. London: 8

(Himalayan Mountains = Simla-Almora area)

Baker, FBI No. 1039, Vol. 3: 102

Plate 103, fig. 9

LOCAL NAME. *Wjet tont* (Kashmir, all grosbeaks).

SIZE. Myna; length c. 22 cm (8 1/2 in.).

FIELD CHARACTERS. A large black-and-yellow massive-billed finch. Male. Above, head, wings and tail dull black. Broad collar, centre of back and rump lemon-yellow. Below, sides of head and throat, and thighs, dull black. Rest of underparts lemon-yellow.

Colour pattern of male almost identical with that of *M. affinis*, but thigh dull black r. yellow. Yellow is paler and black duller, but differences not appreciable in the field. Better identified by voice, q.v.

GOLDFINCHES AND ALLIES

125

Female. Above, grey with buff rump and blackish wings and tail. Below, throat and breast grey-brown; belly buff.
Female quite different from that of *affinis* and easily recognized by buff rump and belly.

STATUS, DISTRIBUTION and HABITAT. Fairly common resident, subject to vertical movements. The western Himalayas from N.W.F.P. (Safed Koh and Chitral) east to central Nepal (Gandak-Kosi watershed, Proud, JBNHS 51: 667). Breeds mostly between c. 1800 and 3000 m, up to 3300 m

Mycerobas icteroides and *M. affinis*

Distributional ranges

▨ *M. icteroides* (1982). ■ *M. affinis* (1983).
▤ Range overlap.

in the Safed Koh and to 3500 m in Astor. Commonly occurs down to c. 1500 m in winter, occasionally as low as c. 750 m; may be seen at these low levels until June after cold spells. Affects pine, silver fir and deodar forest; in winter also oak woods.

Extralimital. Northeastern Afghanistan.

GENERAL HABITS. Found in pairs or small scattered flocks. Usually frequents the tops of high trees but freely descends to feed in low undergrowth or on the ground, where it progresses in hops like a sparrow. Has been observed collecting to roost in dense bushes.

FOOD. Berries and small fruits taken in shrubs or undergrowth, pine and crab-apple seeds, fresh pine shoots. Insects, particularly in breeding season; once observed eating a 'fair-sized slug'.

VOICE and CALLS. A conversational *chuck* uttered by both sexes while feeding. Normal call (male only?) a high-pitched rapid *pir-riu, pir-riu, pir-riu* . . . , reminiscent of a railway guard's whistle (the kind with a pea in

GOLDFINCHES AND ALLIES

127

STATUS, DISTRIBUTION and HABITAT. Resident, subject to vertical movements, locally common. The Himalayas from Hazara east to Bhutan and Arunachal Pradesh. Breeds in a higher zone than *M. icteroides*, from c. 2700 m, mostly above 3000 m, up to tree-line (c. 3600 m in Garhwal, 3900 m in Nepal, 4000 m in Sikkim, Bhutan and southeastern Tibet), wandering above tree-line to c. 4200 m after the breeding season and occasionally descending in winter to c. 1800 m. Affects forests of oak, rhododendron or mixed conifer and broad-leaved trees, occasionally wandering into dwarf rhododendron and juniper scrub above tree-line.

Extralimital. Extends to northern Yunnan, Szechuan and southern Kansu.

GENERAL HABITS. Keeps in pairs or small flocks according to season. Frequents the tops of high trees, freely descending to the ground for feeding purposes.

FOOD. Seeds, kernels, fruits, insects, caterpillars (once a snail).

VOICE and CALLS. Song, a fine loud musical whistle of five to seven notes, the first six falling into two series of three ascending notes each, the seventh note pitched much lower: *ti-di-li-ti-di-li-um*, emphasis on first and fourth syllables; also rendered as *hi-diddle-diddle-the-fiddle*. Alarm, a double note somewhat resembling the striking together of two stones, and might be written as *kurr* (A. E. Osmaston). A loud creaky song lasting about 30 seconds, punctuated by musical bulbul-like notes, and constantly repeated, has also been described (Sálim Ali, 1962).

BREEDING. Season, on circumstantial evidence, May and June. Nest and eggs unknown.

MUSEUM DIAGNOSIS. Male distinguished from *M. icteroides* by its yellow thighs (v. dark brown); black parts are deeper black with a slight purple gloss; yellow parts are more orange and the hind-collar ochraceous yellow.

Young male like adult male but yellow of upperparts duller and paler, that of underparts dingy oil-yellow. Black of crown duller. Sides of head, chin and throat blackish with faint brown centres and fringes.

Young female like adult female but hind neck and mantle a little duller. Rump suffused with yellow. Throat buffy white in centre. Rest of underparts dull greyish olive tinged with yellow.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail

2 ♀♀	121, 132	27	26	87 mm
			(MD, Stevens)	

Weight 3 ♂♂ (May) 69-72; 1 ♀ (May) 83 g (GD).

COLOURS OF BARE PARTS. Female, winter: Iris brown. Bill greenish blue. Legs and feet fleshy.

MYCEROBAS CARNIPES (Hodgson)

Key to the Subspecies

Darker *M. c. carripes*.
Paler *M. c. speculariger*

CARDUELINAE

126

it), given in short, somewhat subdued blasts (SA); syllabified by Magrath as *twenty-two* or *keeky-too*. Song of male, a rich, clear and pleasing *prrr-trooet-t-trooet* (SA).

BREEDING. Season, April to July, chiefly May and June; a female collected in September had an incubation patch and a well-developed egg in ovary. Nest, a rather large cup of fine twigs, grass, moss and lichen, lined with fine grass and rootlets. Placed between 3 and 18 metres above the ground, generally close to the trunk of a conifer. Eggs, 2 or 3, greenish white (Magrath) or pale grey sometimes tinged with green, with deep purple-black spots, scrolls and lines with secondary markings of very fine pale brown and lavender-grey lines and specks; markings usually confined to large end where forming a broad ring. Average size of 40 eggs 28.3 × 19.9 mm (Baker). Building by both sexes; other details unrecorded.

MUSEUM DIAGNOSIS. See Field Characters.

Young female like adult female but upperparts more brownish. Rump brighter buff. Throat and breast ashy mottled with brownish. Rest of underparts paler.

Young male differs from young female in having the rump pale yellow. Post-juvénal moult of body, lesser median and ? greater coverts.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	126-136	c. 29	c. 25	88-97 mm
♀♀	122-128	c. 27	c. 23	
		(Wing and tail, Baker; bill and tarsus, MD)		

COLOURS OF BARE PARTS. Iris dark brown. Bill green in summer (Abbott), wax-yellow in winter. Legs and feet pale flesh or brownish flesh.

1983. Allied Grosbeak. *Mycerobas affinis* (Blyth)

Hesperiphona affinis Blyth, 1855, Jour. Asiat. Soc. Bengal 24: 179
(Alpine Punjab, restricted to Hazara by Whistler, 1925, JBNHS 30: 700)
Baker, FBI No. 1040, Vol. 3: 103
Plate 103, fig. 10

LOCAL NAME. *Wyet toni* (Kashmir).

SIZE. Myna; length c. 22 cm (8½ in.).

FIELD CHARACTERS. A large black-and-yellow, massive-billed finch.

Male. Above, head, wings and tail deep black. An ochraceous yellow hind-collar. Centre of back and rump yellow. Below, throat black, rest of underparts yellow.

Colour pattern almost identical with that of *M. icteroides* q.v., but thighs yellow v. dull black. Better identified by voice.

Female. Above, head dark grey. Rest of upperparts olive-green, more yellowish on collar and rump. Wings and tail blackish. Below, throat grey. Rest of underparts yellowish olive.

Rather similar to *M. carripes* female but lacking white wing-patch and with the grey restricted to throat. For differences from female *M. icteroides* see 1982, under Field Characters.

CARDUELINAE

1984. Persian Whitewinged Grosbeak. *Mycerobas carripes speculariger* (Brandt)

Coccothraustes speculariger Brandt, 1841, Bull. Acad. Imp. Sci.
St. Petersb. 9, col. 11 (N. Persia)
Baker, FBI No. 1041 (part), Vol. 3: 104

LOCAL NAMES. None recorded.

SIZE. Myna; length c. 22 cm (8½ in.).

FIELD CHARACTERS. As in 1985, q.v.

STATUS, DISTRIBUTION and HABITAT. Resident, subject to vertical movements, locally common. Pakistan from Kalat north to the Safed Koh. Breeds

Mycerobas carripes

▨ Distributional ranges 1 *speculariger* (1984), 2 *carripes* (1985).

between c. 2400 and 3600 m, descending to lower levels in winter. Affects juniper forest.

Extralimital. Afghanistan and the mountains of northwestern Iran and Transcaspi.

GENERAL HABITS, FOOD and VOICE. As in 1985.

BREEDING. Season, June, July and presumably later. Nest and eggs, as in 1985.

MUSEUM DIAGNOSIS. Differs from *carripes* (1985) in being paler and smaller: male less black above, more slaty; female paler above and below.

Baker, *FBI No.* 1041 (part), Vol. 3: 104
Plate 103, fig. 13

LOCAL NAMES. *Wyet tont* (Kashmir); *Devi dar* (Lahul).

SIZE. Myna; length c. 22 cm (8½ in.).

FIELD CHARACTERS. A large, dark finch with massive bill, and white wing-patches particularly conspicuous in flight.

Male. *Above*, black with a white wing-patch, yellowish olive rump and a few spots of same colour on secondaries. *Below*, throat and breast black; belly wax-yellow.

Distinguished from *M. melanozanthos* (1986) by yellowish olive rump (v. blackish) and much more extensive black on underparts.

Female. *Above*, head and back grey. Rump wax-yellow. Wing grey-brown with a white patch, yellowish bar, and pale yellow and whitish pattern on secondaries. *Below*, sides of head, throat and breast grey lightly mottled with buff. Flanks and lower belly wax-yellow.

Female distinguished from those of *affinis* and *icterioides* by white wing-patch.

STATUS, DISTRIBUTION AND HABITAT. Common resident, subject to vertical movements. The Himalayas from Gilgit and Hazara east to Arunachal Pradesh. Breeds between 3000 and 3600 m in western Himalayas and up to 4200 m from Garhwal eastwards. Affects dwarf juniper forest above timber-line, and mixed juniper and fir near timber-line; at lower elevations mixed fir, rhododendron, juniper, or fir forest with bamboo undergrowth, or pine woods, especially in the west. Descends to c. 2700 m in winter, sometimes down to 1500 m, but does not entirely leave the higher levels and has been recorded as high as 4200 m in that season.

Extralimital. Ranges west to Turkestan (Tarbagatai and Tien Shan) and east to southeastern Tibet, northern Yunnan, Szechuan, southern Kansu and Tsinghai.

GENERAL HABITS. As a rule less shy than other grosbeaks. Keeps in pairs or small flocks according to season. Very noisy while feeding, the characteristic cracking sound of stones of juniper and other fruits being audible 20 or 30 metres away. If alarmed will sit silent and motionless in the foliage; if hunted out the party will scatter in all directions with clumsy whirring, dipping flight as of a woodpecker, the individuals continuing their rasping alarm-note till reunited.

FOOD. Juniper seeds apparently the staple food: 'The bird thrusts its beak into the meat and with the sharp edge of the "jaws", simultaneously assisted by the very peculiar spoonlike tongue, very quickly cleans the stone from meat and shell which fall on the ground' (Dolgushin *et al.*, 1968). Also other seeds, kernels and berries (strawberries and seeds of *Rumex* among others have been noted). Young fed on juniper seeds and insects.

VOICE AND CALLS. 'Frequently seen perched in some prominent position uttering its familiar notes *wil-ye-go-ame* or *croak-et-et*' (Whitehead), the first

Male. *Above*, entirely blackish with whitish spots on secondaries and a white wing-patch (concealed when wing folded). *Below*, throat and upper breast blackish. Rest of underparts deep yellow.

Distinguished from *M. carpinus* by blackish rump (v. yellowish olive), less extensive black below and much brighter yellow belly.

Female. *Above*, like male but

crown, nape and back streaked with yellow; yellow streaks forming a distinct supercilium. *Below*, yellow boldly streaked with blackish, this character easily identifying female.

STATUS, DISTRIBUTION AND HABITAT. Rather uncommon resident, subject to vertical movements. The Himalayas from the Indus Valley east through Arunachal Pradesh, thence south through the Patkai Range, Nagaland, north Cachar and Mizo Hills (Koelz, loc. cit.), Khasi Hills. (Baker) and

Mycerobas melanozanthos

Distributional range

Manipur (Hume). Altitudinal distribution imperfectly known. Recorded nesting at c. 2400 m in the western Himalayas and in summer between 3000 and 3600 m in Bhutan. On Mt Victoria between 2000-2500 m. In

130

CARDUELINAE

rendition apparently the song (seldom heard), the second a call-note; song also described as *dja-dji-dji-dju* (MD).

BREEDING. Season, June to August in the western Himalayas; in eastern Nepal females not in breeding condition until August (GD). Prolonged nesting period apparently due to different local climatic conditions (Dolgushin *et al.*). Nest, a deep cup of twigs, weed-stems and occasionally some moss or dry leaves with an inner layer of juniper bark fibre. Placed in junipers within a couple of metres from the ground or in spruce or other trees, sometimes as high as 20 metres. Eggs, normally 3, sometimes 2, pale greenish grey spotted and scrawled with purple-black and with pale purple markings. Average size of ten eggs 27 × 19.1 mm (Baker). Building of nest by female alone, male only accompanies her. Incubation by both sexes, chiefly by female; period 15 or 16 days. Care of young by both parents; nestling period about 20 days. For further details on biology (including moult) in Kazakhstan see Dolgushin, I. A. *et al.*, 1968, *JBNHS* 65: 105-10.

MUSEUM DIAGNOSIS. See Field Characters. For distinction from *speculigerus* see 1984, Museum Diagnosis. Complete postnuptial moult August to October.

Young. *Above*, olive-brown with subterminal tiny pale markings and darker tips; rump as in adult. Wing-coverts dark brown, lesser and median with greenish yellow tips, greater with greenish yellow tips to outer webs. *Below*, ashy brown with pale shaft lines.

Immature male (first-year) similar to old female; may occasionally breed in this dress. Adult plumage assumed after first year, in July-October.

132

CARDUELINAE

winter descends to c. 1200 m, occasionally 900 m in the west, and down to 600 m in the Bhutan foothills. Affects mixed conifer and broad-leaved forest.

Extralimital. Extends to southeastern Tibet, Szechuan, Burma (Mt Victoria, Myitkyina dist., southern Shan States), Yunnan and northern Thailand.

GENERAL HABITS. Keeps in pairs or flocks according to season; flocks usually small but sometimes up to c. 50 birds, or more. Frequents and often feeds in the tops of tall trees. When disturbed usually flies high in the air. Becomes quite noisy after the breeding season when it collects in large flocks. A feeding congregation keeps up a running chorus of a peculiar cackling reminiscent of the cacophony of *Garrulus leucolophus* (1283). This, augmented by the sound of cracking cherry stones and the constant patter of discarded shells on the dry litter under the tree, usually announces the presence of the birds a long way off. Also feeds on the ground.

FOOD. Kernels of wild cherry (*Prunus*), *Myrica*, etc.; berries of *Viburnum*.

VOICE AND CALLS. A variety of calls, the most familiar being a rattling note rendered as *krrrr* or *chüräräk*, somewhat similar to the distant call of a magpie, usually uttered in flight but also during feeding — likened in the distance also to the shaking of an ordinary match-box containing only a few matches! Also some mellow and somewhat oriole-like whistles *tyop-tio* or *tyo-tyo* and a variety of parrot-like notes; a remarkably human note like the exclamation *ah* pronounced with an ascending inflection (Magrath).

BREEDING. Season, May to July. Nest, a cup of twigs, grass and moss lined with rootlets and maidenhair stems, placed in trees about four metres or higher above the ground. Eggs, 2 or 3, pale green marked with streaks and blotches, similar to eggs of *M. icteroides* but markings decidedly more reddish brown. Measurements, 2 eggs 30 × 20.6 mm (Baker), 3 eggs 26.6 × 20.5 mm (Skinner, *JBNHS* 18: 907).

MUSEUM DIAGNOSIS. See Field Characters; for details of plumages Whistler, *JBNHS* 29: 152-3. A complete prenuptial moult ending about April (Biswas, 1963, *JBNHS* 60: 200) [no spring moult according to HW who recorded a specimen moulting remiges in November]. First-winter plumage like adult female's but yellow replaced by creamy white.

MEASUREMENTS

LOCAL NAMES. None recorded.

SIZE. Sparrow; length c. 15 cm (6 in.).

FIELD CHARACTERS. As in 1989 but hindcrown and band reaching sides of neck black.

STATUS, DISTRIBUTION and HABITAT. Rare winter vagrant. A specimen collected at Quetta in February in a flock of grey-headed birds (Meinertzhagen, *Ibis* 1920: 138).

EXTRALIMITAL. Breeds in western Siberia from the Urals to the Yenisey and western Altai, south to Semipalatinsk. In winter normally reaches Turkmenia and Turkistan.

GENERAL HABITS, FOOD and VOICE. As in 1989.

MUSEUM DIAGNOSIS. Distinguished from *caniceps* chiefly by black hindcrown, extending in a band to sides of neck; also by somewhat larger size and heavier bill. For details of plumage see Baker, loc. cit.

MEASUREMENTS

Wing ♂♂ 85-89 mm; ♀♀ 77-85 mm (Dementiev)

COLOURS OF BARE PARTS. Iris brown. Bill pinkish horn with dark tip. Legs and feet pale horn brown.

LOCAL NAMES. *Shaira* or *Schura* (Kashmir).

SIZE. Sparrow —; length c. 14 cm (5½ in.).

FIELD CHARACTERS. Above, forehead crimson; lores black. Crown and back pale grey-brown; rump white. Wings black with a large, conspicuous bright yellow patch. Tail black and white. Below, chin and area around bill crimson bordered with whitish buff. Breast pale grey-brown; belly whitish. Sexes nearly alike.

x c. 1

In flight, a yellowish band across wings, bordered with brown in front and behind, conspicuous white rump and white-and-black tail diagnostic.

STATUS, DISTRIBUTION and HABITAT. Common resident, subject to vertical movements. Pakistan in northern Baluchistan (Williams, JBNHS 33: 605; Christison, JBNHS 43: 482), N.W.F.P. north to Chitral, thence east through Gilgit, Baltistan, Ladakh, Hazara, Kashmir and along the Himalayas to central Nepal (Lowndes, 1955, JBNHS 53: 34; Fleming & Traylor, 1968). Breeds from c. 2400 m up to 3900 m. Occasionally breeds as low as c. 1500 m (Rawalpindi, Thandiani, Vale of Kashmir, Quetta Valley). Near Mussooree, according to Osmaston (JBNHS 31: 995), 'begins nesting towards the end of May between 1500 and 2100 m. After rearing the first brood at this comparatively low altitude, they leave early in July for higher altitudes and have second nests at from 2800 to 3300 m'. Affects orchards near upland villages, bare stony hillsides, open pine and fir forest, fields and scrub and willows, juniper or other scrub above timber-line. Withdraws from the upper levels in winter and descends to the valleys and foothills, occasionally into the adjacent plains (Ambala, Rawalpindi).

EXTRALIMITAL. The species ranges from Central Asia west to the British Isles, the Mediterranean countries and the Azores.

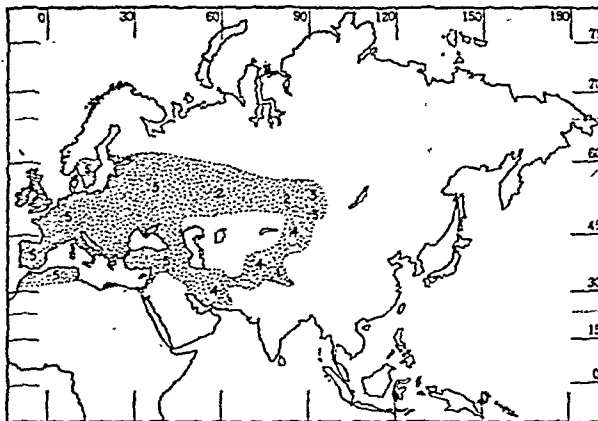

GENERAL HABITS. Keeps in pairs when breeding but small flocks may also be seen throughout the breeding season; in winter usually in larger flocks. Feeds on the ground hopping about, or from flower heads — fluttering and clinging to them and plucking the seeds. Flight slightly undulating, typically sparrow-like.

FOOD. Flower seeds, especially of thistles (*Cirsium* spp.); of sunflower (*Helianthus*) and zinnia in hill-station gardens. Also seeds of the chenar tree (*Platanus orientalis*) in Kashmir in January-February.VOICE and CALLS. Call-note a characteristic *deedlit* or *chirik*. Song, a liquid twittering reminiscent of a canary's; in spring often delivered by several birds in chorus from in among trees.

BREEDING. Season varies according to altitude: April to July at lower elevations, July and August in the high country. See also observation by Osmaston (above) under Status etc. Nest, a neat cup of dry grass, moss,

136

CARDUELINAE

lichen or other material, lined with vegetable down and a few hairs. Placed on branches of pine, fir, fruit trees, willows or junipers, generally between two and nine metres above the ground, sometimes as high as 20 metres; usually towards the end of a branch. Eggs, 4 or 5, pale blue with fine blotches of dark brown and rusty red mostly at the larger end; nearly white unmarked eggs are occasionally found. Average size of 38 eggs 18 × 13.2 mm (Osmaston), of 60 eggs 18.5 × 13.2 mm (Baker). Incubation by female, fed on nest by male. Feeding of young by both parents, by regurgitation. See also Bates, 1960, JBNHS 57: 339-47 for further details.

MUSEUM DIAGNOSIS. See Key to the Subspecies.

Female differs from male only in the smaller extent of crimson about base of bill.

Young, without crimson or black on the face. Upperparts, sides of head, throat and breast pale grey-brown with faint darker tips on the rump mixed with buffy white; upper tail-coverts white with rusty tips and more or less dark central streaks. Underparts whitish sullied with brown on the flanks; lesser, median and greater coverts black with pale buffy brownish tips, heavy on last, faint elsewhere; oval spots on tertials and tips to central tail dull buffy white. Postjuvinal moult of body, lesser, median and greater coverts. First-year birds distinguished by buffy white (v. white) oval spots on tertials.

MEASUREMENTS

FIELD CHARACTERS. Male. Above, crown, ear-coverts, a malar streak and back blackish brown. Forehead, supercilium and sides of neck yellow forming an indistinct collar below the nape. Rump yellow. Wings dark brown with a large yellow patch; inner secondaries edged with white. Tail dark brown; basal half of outer rectrices yellow. Below, yellow.

Female like male but duller, more washed with green above.

GOLDFINCHES AND ALLIES

137

Immature birds heavily streaked.

STATUS, DISTRIBUTION AND HABITAT. Mostly a summer (breeding) visitor to the Himalayas from Hazara and Murree east to Arunachal Pradesh. In Kashmir breeds commonly between 2000 and 2400 m, occasionally up to 3300 m. From Kulu to Simla breeds between 1800 and 2700 m, possibly as low as 1100 m (Kangra) or 1200 m (Simla). In western and central Nepal from 1800 to 3700 m, while in eastern Nepal breeds between 2800 and up to

Carduelis spinoides

Distributional ranges 1 *spincides* (1990), 2 *taylori* (1991), 3 *heinrichi* (1992), 4 extralimital subspecies.

4400 m in scrub above timber-line (Diesselhorst). In Sikkim breeds between 2100 and 3000 m, locally up to 3800 m. In Bhutan very common between 1800 and 3100 m. In winter occurs mostly in the foothills below c. 1300 m in the west, 1500 m in Nepal, and in adjacent plains; in Sikkim observed up to 2700 m in winter (Sálim Ali). Affects cultivation, open slopes and edges of forest, and open pine or deodar forest; freely enters hill-station gardens and compounds. In eastern Nepal also recorded in open forest at timber-line and in pure scrub growth above it (Diesselhorst).

MIGRATION. Generally arrives on breeding grounds in June, staying till the end of October. May be seen in winter quarters from October to the end of May.

GENERAL HABITS. Keeps in pairs or parties according to season, in winter collecting in flocks of 10 to 20 birds or more. Feeds much more in bushes and trees than on the ground, and often feeds on flowerheads in the manner of a goldfinch. Display said to be similar to that of the European Greenfinch, *Carduelis chloris*, namely a song-flight in which 'the male circles round with peculiar erratic bat-like flight with slowly flapping wings' (Witherby).

GOLDFINCHES AND ALLIES

139

STATUS, DISTRIBUTION AND HABITAT. Common resident, subject to vertical movements. Southeastern Tibet and adjacent parts of Arunachal Pradesh. Affects cultivation, open fields, meadows and edges of forest near cultivation at c. 2800–3100 m.

Extralimital. Extends to Szechuan. Other subspecies in northern Burma, Yunnan and Vietnam.

GENERAL HABITS, FOOD AND VOICE. As in 1990.

MUSEUM DIAGNOSIS. Distinguished from both *spinoides* and *heinrichi* in having the whole head nearly black, the back very dark olive and the underparts darker, more olive; belly dirty greyish white.

MEASUREMENTS

Wing ♂♂ 79–83 mm; ♀♀ 78–80 mm (NBK)

COLOURS OF BARE PARTS. Unrecorded.

1992. **Mt Victoria Greenfinch.** *Carduelis spinoides heinrichi* Stresemann
Carduelis spinoides heinrichi Stresemann, 1940, Mitt. Zool. Mus. Berlin 24: 153, 170 (Mt Victoria)

Baker, FBI No. 1089 (part), Vol. 3: 160

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 14 cm (5½ in.).

FIELD CHARACTERS. As in 1990, q.v.

STATUS, DISTRIBUTION AND HABITAT. Resident, subject to vertical movements; apparently uncommon. The hills of Nagaland (Baker, JBNHS 9: 143), Manipur (Ripley, JBNHS 50: 512; Hume, SF 11: 28) and adjacent hills of Burma south to Mt Victoria at c. 2300–2400 m in summer, descending to at least 1400 m in winter. Affects trees in clearings and neighbourhood of cultivation.

GENERAL HABITS, FOOD AND VOICE. As in 1990.

BREEDING. Season, about June (by gonadal evidence). Nest and eggs undescribed, probably as in 1990.

MUSEUM DIAGNOSIS. Differs from *taylori* chiefly in having a yellow supercilium and from *spinoides* in being much darker, the crown and cheeks black, the latter not separated from malar streak by a yellow area.

MEASUREMENTS

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 12 cm (5 in.).

FIELD CHARACTERS. A small yellow-green and brownish finch with a small, pointed bill and slightly forked tail.

138

CARDUELINAE

FOOD. Seeds of many kinds, including wild hemp, sunflower, *Calliopsis*, millet, buckwheat, rice, etc. Also berries and insects.

VOICE AND CALLS. Call-note described as similar to that of European Greenfinch, a characteristic, far-carrying *beez*. Also 'a long-drawn *weeeeeee* dropping at the end, strongly reminiscent of Iora' (Smythies). Song, resembling Goldfinch's, uttered from the tops of trees or in the song-flight (above). Some soft, twittering call-notes uttered in flight. (Observers' descriptions as 'call-notes' and 'song' rather ambiguous.)

BREEDING. Season, quite late, beginning towards the end of June or early July, lasting till October at higher altitudes, with a peak in August. Nest, a compact, neat cup of grass stalks and rootlets and moss, lined with fine rootlets, hair and a few feathers; well concealed on the upper surface of a horizontal branch, generally towards the extremity, preferably in deodars (*Cedrus*) or pines, from 2 to 20 metres above ground level, average about 9 metres. Eggs, 3 to 5, normally 4, slightly greenish white usually with an irregular ring of minute blackish brown spots round the large end and a few similar specks scattered here and there. Average size of 80 eggs 18.7 × 13.7 mm (Baker). Building of nest by female only, accompanied by male. Incubation by female only, fed on nest by male; period about 13 days. Care of young by both parents. See Dodsworth, JBNHS 21: 1074–80 for further details.

MUSEUM DIAGNOSIS. See Field Characters and Key to the Subspecies. Sexes can be distinguished by wing-coverts: in the male, the lesser and median coverts are completely yellow, in the female dark brown.

Young similar to female. For details of plumages see Whistler, Ibis 1940: 151–3. Adult bird has one complete moult a year, in May and June. Juvenal plumage retained throughout winter and moulted into adult plumage in complete prenuptial moult.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail

Hypocanthus spinoides taylori Kinnear, 1939, Ibis: 752

(Lilung, Tsangpo Valley, SE. Tibet)

Not in Baker, FBI

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 14 cm (5½ in.).

FIELD CHARACTERS. As in 1990 but whole head nearly black.

140

CARDUELINAE

Male. Above, olive-yellow, mantle faintly streaked with dark brown, rump brighter yellow. An ill-defined supercilium and collar bright yellow. A yellow wing-bar. Tail-feathers dark brown edged with yellow. Below, deep yellow washed with olive on sides of neck and flanks.

Female, like male but duller and streaked with dark brown above and below excepting throat and upper breast.

Immature, like female but more heavily streaked and with abdomen whitish.

STATUS, DISTRIBUTION AND HABITAT. Mostly a winter visitor to the eastern Himalayas, from central Nepal (Proud, JBNHS 51: 737, 53: 66; Rand & Fleming, Fieldiana 41: 202) east through Sikkim (Sálim Ali, 1962; Meinertzhagen, 1927), Bhutan (SA) and Arunachal Pradesh between 1000 and 3000 m

Carduelis thibetana

■ Known breeding or summer records. --- Known winter range.

(in Burma as low as 600 m). Presumably breeds in northern Arunachal as birds have been recorded in summer in Tibet near or on the border (Lusha La) between long. 93° and 94°E. (Ludlow, Ibis 1914: 356); possibly breeds farther west (loc. cit.: 357). Observed in summer between 2800 and 3000 m in hemlock (*Tsuga*), birch and mixed fir and birch forest near tree-limit. In winter, known to frequent alders and *Tsuga*.

Extralimital. Breeds in southeastern Tibet, and western Szechuan. Winters to northern Burma and northern Yunnan.

MIGRATION. Recorded in winter quarters from 20 December to 8 March.

GENERAL HABITS. Found in pairs in the breeding season (May–June) otherwise in flocks of 10 to 50, sometimes up to several hundred birds ('literally swarms' — Proud). Feeds largely among the tops of alders, birch, etc.; also on the ground under conifers, sometimes in thick undergrowth.

GOLDFINCHES AND ALLIES

141

FOOD. Seeds of alders (*Alnus*), birch (*Betula*) and conifers.

VOICE and CALLS. When in flocks in trees 'keeps up a continual hard tremulous twittering, at times quite deafening — sounding in the distance like starlings going to roost. Never silent for a minute'. Song, heard in March, 'a mere variation of the twittering with many trills added' (Proud). When taking wing, utters a series of finch-like notes (Ludlow).

BREEDING. Season, birds have been observed keeping paired in May and June. Nest and eggs unknown. Cf. Ludlow & Kinnear, *Ibis* 1944: 357.

MUSEUM DIAGNOSIS. See Field Characters.

First-year male and female like adult but paler yellow on underparts; flanks more streaked. Greater coverts and tertials yellowish white instead of olive-green.

FIELD CHARACTERS. A small brown finch with pink rump and distinctly forked tail.

Male. Above, fulvous brown streaked with dark brown. Two buffish wing-bars. Rump pale pink. Tail dark brown with white outer edge. Below,

142

CARDUELINAE

Baltistan, Rawalpindi and Jhelum districts, Salt Range and northern Baluchistan (Quetta dist.). Affects open country, cultivation, and stony slopes at base of hills; in Baltistan up to 2400 m.

Extralimital. Breeds from northern Afghanistan north to the Altai and west to Turkey and the Caucasus. The species extends to Morocco, the Canary Islands, the British Isles and southern Scandinavia.

MIGRATION. Recorded in winter quarters from October to early April.

GENERAL HABITS. A rather shy but sprightly bird usually met with in small flocks of 4 or 5 individuals. Often settles on tops of trees and bushes. Feeds on the ground, or from flowerheads.

FOOD. Seeds; particularly fond of wild hemp (*Cannabis* sp.).

VOICE and CALLS. A twittering note continually uttered in flight. A lively musical song may be heard in February–March.

BREEDING. Extralimital.

MUSEUM DIAGNOSIS. See Field Characters.

Baker, FBI No. 1086, Vol. 3: 157

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 13 cm (5 in.).

FIELD CHARACTERS. As in 1996, q.v.

STATUS, DISTRIBUTION and HABITAT. Resident, subject to vertical movements. Northern Pakistan in Chitral (Fulton, *JBNHS* 16: 53), Gilgit (Ludlow, *Ibis* 1933: 664) and Baltistan (Meinertzhagen, *Ibis* 1927: 378 and 379). Breeds mostly between 3600 and 4200 m, occasionally lower, descending in winter to c. 1500 m in Gilgit. Affects stony and grassy slopes.

Birds collected in August can hardly be migrants as many birds nest until September and the species does not seem to wander far from its breeding grounds. This does not exclude the possibility that birds from the Pamirs may occur in winter within our limits. We follow Ludlow (loc. cit.) and Hellmayr (1929, *Field Mus. Nat. Hist. Zool.* 17: 45) in considering these populations as *montanella*, the apparent variations probably being evidence of intergradation with *rufostriata*.

144

CARDUELINAE

fulvous brown, breast and flanks streaked with dark brown. Belly cream-buff.

Female, similar to male but no pink on rump.

STATUS, DISTRIBUTION and HABITAT. Common resident, subject to vertical movements. Ladakh, Spiti and east along southern Tibet (Sálim Ali, *JBNHS* 46: 300; Kinnear, *Ibis* 1922: 520), north-central Nepal (in June — Deshayes, *Ibis* 1965: 400) and northern Sikkim (at least in winter). Breeds between 3600 and 4800 m, seldom down to 3400 m; optimum zone 4000–4500 m. Does not seem to descend much in winter, the lowest records being about 3000 m. Affects screes and stony hillides with Tibetan furze (*Coragana*) usually in arid country, or boulder-strewn alpine meadows; also cultivation and *Hippophae* scrub, especially in winter.

Extralimital. Southern Tibet east to Rong Chakar (Ludlow). The species has a discontinuous range in central Asia, the Middle East, Scandinavia and the British Isles.

GENERAL HABITS. Keeps in pairs or small flocks according to season, often collecting in large flocks in winter. Feeds on the ground, running among stones like *Calandrella* larks; also in low bushes or on thistle-heads.

FOOD. Seeds.

VOICE and CALLS. Call-note uttered in flight, a double *twit-twit* (SA) or a triple *dje-dje-dje* (MD). Song undescribed.

BREEDING. Season, May to end of August. Nest, a compact cup of dry grass thickly lined with wool or hair, placed low down in furze bushes etc. usually within 60 cm from the ground, sometimes up to 2 or 3 metres in dwarf willows, or on the ground among sedges. Eggs, 3 to 5, very pale blue marked with pink to reddish brown spots, chiefly in a zone at the large end. Average size of 46 eggs 18 × 13.2 mm (Osmaston), of 30 eggs 18 × 13 mm (Ludlow). Considerably variable in shape, some eggs being very dumpy, others very elongate: maximum 20 × 13.4 and 19 × 13.5 mm, minimum 16.5 × 12 mm (Ludlow).

MUSEUM DIAGNOSIS. Differs from *montanella* (1995) in being darker, more heavily streaked, in having a richer, redder tone on upperparts, and in being more buff to clay colour rather than buffy white on underparts. Bill thicker.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	77-85	c. 11	c. 19	55-64 mm
♀♀	73-81			(Vaurie, RM, MD)

COLOURS OF BARE PARTS. Iris brown. Bill horny white to pale fleshy with pink tinge. Legs and feet dark brown or blackish brown.

Genus *GALLACANTHIS* Bonaparte

Callacanthis Bonaparte, 1850, *Consp. Gen. Av.* 1: 507. Type, by monotypy, *Cerdulus Burtai* Gould

Bill like that of *Cerdulus* but much stouter and both wide and deep at base. Wings long. Sexes not alike.

Cf. Deshayes, M., 1969, *L'Oiseau* 39: 21-7 for affinities.

GOLDFINCHES AND ALLIES

(Himalaya = Srinagar)
Baker, FBI No. 1083, Vol. 3: 152
Plate 103, fig. 3

LOCAL NAMES. None recorded.

SIZE. Sparrow +; length c. 17 cm (6½ in.).

FIELD CHARACTERS. Male. Above, forehead, supercilium and round eye crimson; crown black; back brown. Wings black spotted with white; tail black, outer rectrices and tip white. Below, chin and throat pinkish red; sides of throat and cheeks black. Rest of underparts fulvous brown washed with pinkish red.

x c. 1

The white-spotted wings and wide crimson or yellow ring round the eye identify both sexes respectively.

STATUS, DISTRIBUTION AND HABITAT. Resident, subject to vertical movements, locally common (very local east of Kumaon). The Himalayas from Safed Koh (Whitehead, *Ibis* 1909: 230) and Chitral (Fulton, JBNHS 16: 53) east through Hazara, Kashmir, Himachal Pradesh, Uttar Pradesh, Nepal (Proud, JBNHS 58: 804, only record) and Sikkim (Stevens, JBNHS 30: 371, only record). Breeds between 2400 and 3000 m (Safed Koh, Chitral), 2400 m to tree-line in Kashmir, optimum zone 2700-3000 m. In winter (November to April) occurs down to c. 1800 m, occasionally 800 m; Sikkim record in winter at c. 3000 m. Affects fairly open forest of fir, pine or deodar, occasionally birch.

GENERAL HABITS. Usually a remarkably tame and confiding species. Keeps in pairs in the breeding season, otherwise in small flocks of 6 to 12, occasionally up to 30 individuals. Feeds mostly on the ground, hopping about in undergrowth, flying up into nearby bushes and trees when disturbed, uttering soft *teus*. Descends in ones and twos to resume feeding immediately the disturbance has passed.

Display. Male vibrates his drooping wings like a sparrow, uttering a little trill. Display also said to remind one of a Goldfinch's.

FOOD. Seeds (of deodar, mountain ash, etc.).

VOICE AND CALLS. Ordinary call-note, a loud and clear whistle, higher in tone but not unlike ordinary call of bullfinch (BBO), 'pweee' often followed by notes like *puwu*, *puwewu* or *chipewu* (su like the French), all plaintive and melodious (Magrath) — usually given from high up on a bare branch. Alarm-note, a double *uh-eh* or *twee-yeh*, the second note a half-tone higher. Song described as 'not unlike the *til-til-til* notes of the Goldfinch but with more volume' (Jones, MS.).

BREEDING. Season, May to July. Nest, a rather massive cup of moss, lichen, grass stalks, twigs, fern stems or pine needles, thickly lined with goat-

CARDUELINAE

146

cattle- or even human hair and some feathers; placed in conifers from 3 to 21 metres above the ground. One site has been described as a semi-open forest interspersed with small meadows. Eggs, apparently 3, greenish blue, sparingly spotted with blackish brown or black at the large end. Average size of 3 eggs 24.3 × 16.4 mm. Building by both sexes; part of the material appears to be collected on trees; the birds do not fly directly to the nest but alight some distance below it and work their way up. Male seen feeding sitting female by regurgitation. For notes on breeding see Waters, H. P. E., JBNHS 46: 721; Bates & Lowther, 1952: 163-5.

MUSEUM DIAGNOSIS. See Field Characters.

Young. Head uniform brown without coloured supercilium (for details of plumage see Richmond, 1894, Proc. U.S. Nat. Mus. 17: 461).

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail

LOCAL NAMES. *Tiok* (ad.), *Taer* (juv.) [Kashmir].

SIZE. Sparrow —; length c. 12 cm (5 in.).

FIELD CHARACTERS. A small dark finch with blackish head and glittering scarlet forehead. Above, forehead scarlet-orange; crown dark brown; nape grey. Back yellowish buff streaked with dark brown; lower rump yellow. Shoulder and edge of wing yellow with two white bars. Tail dark brown with whitish edges. Below, throat, sides of head and upper breast sooty brown, the feathers broadly fringed with grey. Belly and flanks pale yellow with dark brown streaks. Sexes alike.

x c. 1

STATUS, DISTRIBUTION AND HABITAT. Common resident, subject to vertical movements. Pakistan from northern Baluchistan north to Chitral, thence east through Gilgit, Baltistan, Ladakh, northern Kashmir, Lahul, Spiti and Garhwal. Breeds between 2400 and 3000 m (Baluchistan) and between

GOLDFINCHES AND ALLIES

147

Serinus pusillus

Distributional range

3000 and 4000 m in the Himalayas, locally down to 2400 m or up to 4300 m (Ladakh, Spiti, Garhwal). In summer frequents dwarf junipers at and above timber-line, shingle scree and rocky hillsides with stunted bushes, birches and willows near cultivation. Winters (November to March) between 3300 and 1500 m, occasionally down to c. 750 m (Sind), seldom lower (Sukkur in Sind). In this season affects open hillsides and stony ground with bushes and coarse herbage.

Extralimital. Southern Tibet (Sálim Ali, JBNHS 46: 300; Lavkumar, *ibid.* 53: 325), north in Turkestan to the Tarbagatai and west to Turkey.

GENERAL HABITS. Keeps in restless flocks in the non-breeding season — small flocks in autumn, large ones in winter — ever on the move. Feeds mostly on the ground; also from low bushes and weeds often springing up 30 cm or so and fluttering against the flowerheads to pluck the seeds. When disturbed the flock flies up to the bare tops of nearby trees or bushes, all the birds alighting simultaneously in a distinctive way. They are avid drinkers and may be seen drinking and bathing at all times of day at any available water.

FOOD. Seeds of thistles (*Carduus*), *Artemisia*, *Plectranthus*, *Sisymbrium*, and other weeds and grass; mulberries.

VOICE AND CALLS. A constant, feeble but sharp *tree, tree* rapidly repeated twice and a musical *chiririri* (SA). Song described as a soft, pleasant, rippling twitter — a more sustained version of the call-note (HW).

BREEDING. Season, June to August, mainly in the last two months. Nest, a cup of grass, strips of bark and rootlets thickly lined with wool, hair or vegetable down, plastered externally with spider-web; placed in rose bushes, junipers or briars between one and six metres above the ground; one nest

CARDUELINAE

148

observed in a cleft in a cliff two metres above the ground. Eggs, 4 or 5, pale bluish green marked with rusty red and dark brown, occasionally unspotted. Average size of 85 eggs 16.7 × 12.6 mm (Osmaston).

MUSEUM DIAGNOSIS. See Field Characters.

Young. Upperparts, lesser and median coverts light rufous brown streaked with dark brown. Tertiaries and greater coverts black with broad pale rufous brown tips and edges. Rest of wing and tail as in adult. Sides of head, chin and throat plain rufous brown. Rest of underparts light rufous brown with dark streaks on breast and flanks. Postjuvénal moult of body-feathers, lesser, median and greater coverts, tertiaries and central rectrices.

First-year male and female like adult but whole crown and sides of head brown. Chin and upper throat dull yellowish white or rufous white. Tertiaries margined with fulvous white. Prenuptial moult of head, chin and throat, thus acquiring the red forecrown and blackish parts of the adult.

MEASUREMENTS

(Uimon, Altai)

Baker, FBI No. 1116, Vol. 3: 192

LOCAL NAME. *Kib-cht* (= 'hill bird', Tibetan).

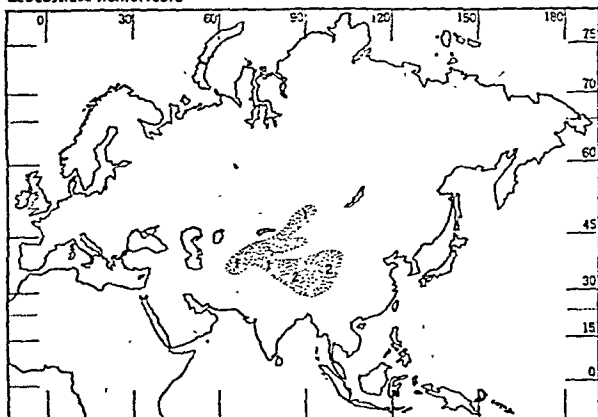

SIZE. Sparrow; length c. 15 cm (6 in.).

GOLDFINCHES AND ALLIES

149

FIELD CHARACTERS. Resembles a dark slim female House Sparrow, with a somewhat finer bill and distinctly forked tail. Above, brown streaked with darker brown. An indistinct pale supercilium. Wings dark brown with a buff bar and buff edges to tertials. Rump grey, upper tail-coverts with broad white tips. Tail dark brown. Below, pale grey-brown, sides of breast and flanks streaked with dark brown. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Common resident, subject to erratic vertical movements. The western Himalayas from Chitral east through Gilgit, Ladakh and Kashmir to Kumaon. Breeds above timber-line (c. 3300 m in Kashmir), mostly above 3600 m and up to 4200 m (Chitral) or 4800 m

Leucosticte nemoricola

■ Distributional ranges 1 *altaica* (1999), 2 *nemoricola* (2000).

Ladakh, Spiti). Affects screes and stony grassy slopes in desolate country. Descends in winter (October to early April) to c. 1500 m, occasionally 1000 m (Kangra) but does not entirely leave the higher levels. In this season frequents cultivation about villages, terraced fields and open hillsides but apparently shuns the more sunny sides of hills.

Extralimital. Western Tibet and northern Afghanistan north to the Altai and the Sayans.

GENERAL HABITS. A highly gregarious species congregating in huge flocks, of 200 or more birds, in winter; keeping in smaller flocks even in summer. Feeds on the ground among stones and boulders, often on the edges of melting snow, flying up into bare tree-tops when disturbed. Behaviour when feeding very reminiscent of sparrow, this likeness enhanced by sparrow-like dress. Immature birds apparently descend lower in winter than adults, which remain at higher altitudes.

GOLDFINCHES AND ALLIES

151

wide area, alighting on the ground in a dense mass from time to time and taking off again almost immediately to resume the wheeling, without apparent cause.

Display. Male displays in a peculiar manner with tail erect, not fanned, wings hanging and dragged on the ground, head held high with the bill pressed on the chin, and thus running here and there behind the female (Schäfer).

FOOD. Chiefly seeds.

VOICE AND CALLS. A sharp twitter sounding like *rick pi titt* or *dui dip dip dip* (Schäfer).

BREEDING. As in 1999.

MUSEUM DIAGNOSIS. Like *altaica* but upperparts a little deeper rufous and underparts a little darker. Tips to median and greater coverts white. Axillaries pale yellow (v. ashy white).

MEASUREMENTS

Leucosticte brandti Bonaparte, 1850, *Consp. Gen. Avium* 1: 537 (Siberia, *error* = Turkistan, restricted to Zailiisk Ala Tau by Vaurie, 1959, *Bds. Pal. Fauna* 2: 621 Baker, FBI No. 1117 (part), Vol. 3: 193

LOCAL NAMES. None recorded.

SIZE. Sparrow +; length c. 18 cm (7 in.).

FIELD CHARACTERS. As in 2003, q.v.

STATUS, DISTRIBUTION AND HABITAT. Straggler to Gilgit (*Ibis* 1881: 88). **Extralimital.** Breeds in Turkistan from western Tien Shan to western Sinkiang.

GENERAL HABITS, FOOD AND VOICE. As in 2003.

MUSEUM DIAGNOSIS. See Key to the Subspecies.

150

CARDUELINAE

Display. Male extends wings to their full length and waves them about by way of courting (HW).

FOOD. Chiefly small seeds; also insects.

VOICE AND CALLS. A soft, lively sparrow-like twitter. A shrill song of one or two monotonous notes frequently repeated from the top of some rock or stone (Brooks).

BREEDING. *Season*, July and August. *Nest*, a shallow cup of dry grass lined with wool and hair placed under a rock or a large flat stone, or inside a burrow 15 cm or so from the entrance, on steep slopes. Marmot burrows frequently used, bird and mammal living peacefully together. Nest also placed in holes in stone walls or heaps of stones; occasionally on a sheltered ledge of rock. *Eggs*, 3 or 4, white. Average size of 25 eggs 20.5 × 15.1 mm (Baker).

MUSEUM DIAGNOSIS. For distinction from *nemoricola* see 2000 under Museum Diagnosis.

Young, like adult but whole crown uniform warmer rufous; upperparts with warmer rufous margins. Underparts uniform pale rufous. Postjuvénal moult of body-feathers, lesser, median and greater coverts.

MEASUREMENTS

Wing ♂♂ 93-100; ♀♀ 90-95 mm (Paludan): rest as in 2000.

Weight 3 ♂♂ (June-July) 20-21; 3 ♀♀ (June-July) 19-21 g (Paludan).

COLOURS OF RARE PARTS. Iris orange-brown (adult male), light brown (female and immature). Bill dark brown, lower mandible paler (yellowish) at base. Legs and feet dark brown; soles (with wart-like pads below joints of toes) primrose yellow.

2000. Eastern Plaincoloured Mountain Finch. *Leucosticte nemoricola nemoricola* (Hodgson)

F. (ringilauda) Nemoricola Hodgson, 1836, *Asiat. Res.* 19: 158 (Nepal)

Baker, FBI No. 1115, Vol. 3: 191

Plate 94, fig. 15

LOCAL NAME. *Kib-che* (= 'hill bird', Tibetan).

SIZE. Sparrow; length c. 15 cm (6 in.).

FIELD CHARACTERS. As in 1999, q.v.

STATUS, DISTRIBUTION AND HABITAT. Common resident, subject to vertical movements: Nepal, Sikkim, Bhutan, Arunachal Pradesh (?). Breeds between c. 4200 and 5300 m, winters between 1500 and 4500 m, mostly above 2000 m. Affects alpine meadows, boulder fields, screes, moraines and dwarf scrub well above tree-line; also cultivation and villages. In winter also frequents open forest slopes and fallow fields.

Extralimital. S. Tibet, N. Yunnan north and east to Kansu, Szechuan and Shensi.

GENERAL HABITS. As in 1999. Usually very wild and restless in winter, the birds flying around incessantly in scattered undulating rabbles over a

Leucosticte pamirensis Severtzov, 1883, *Ibis*: 58
(Pamir, restricted to Tien Shan by Hartert, 1910)
Baker, FBI No. 1117 (part), Vol. 3: 193

LOCAL NAMES. None recorded.

SIZE. Sparrow +; length c. 18 cm (7 in.).

FIELD CHARACTERS. As in 2003, q.v.

STATUS, DISTRIBUTION AND HABITAT. Winter visitor to Gilgit and surrounding region.

Extralimital. Northern Afghanistan to south-central Kirghizistan.

GENERAL HABITS, FOOD AND VOICE. As in 2003.

MUSEUM DIAGNOSIS. Paler than *haematopygia* and like it has pink margins to rump, but also has narrow pink edges to lesser coverts. Darker than *brandti* and more heavily streaked on mantle.

MEASUREMENTS

Wing ♂♂ 111-121 mm (Dementiev).

COLOURS OF RARE PARTS. As in 2003.

GOLDFINCHES AND ALLIES

153

- 2003, 2004. **Himalayan Mountain Finch.** *Leucosticte brandti haematopygia* (Gould)
Montifringilla haematopygia Gould, 1853, Proc. Zool. Soc. London (1851): 115 (Tibet, restricted to Tso Moriri Lake, Ladakh, by Kinnear, 1922, Ibis: 519)
Leucosticte brandti audreyana Stressemann, 1939, Orn. Monatsb. 47: 177
 (Sikkim: Yabuk at Zemu Glacier)¹
 Baker, FBI No. 1118 (part), Vol. 3: 194
 Plate 94, fig. 17

LOCAL NAMES. None recorded.

SIZE. Sparrow +; length c. 18 cm (7 in.).

FIELD CHARACTERS. A dark-coloured finch with rosy rump and forked tail. Above, forehead, 'face' and crown dark brown. Rest of upperparts paler brown scalloped with sandy, with a large whitish patch on wing and pale shoulders; rump rosy pink. Outer edge of tail white. Below, drab grey. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Common resident, subject to vertical movements. From Chitral (Fulton, JBNHS 16: 55) east along the Karakoram and northern Himalayas through Baltistan, Ladakh, Lahul, Spiti, Nepal (Biswas, JBNHS 60: 194; Diesselhorst, 1968) and Sikkim (Sálim Ali, 1962). Breeds above c. 4200 m, locally down to c. 3900 m (Chitral, Spiti), and up to 5400 m, generally in a higher zone than *L. nemoricola*. In winter some birds descend to the valleys at c. 3000 m in the west, 3600 m in Sikkim. Most birds apparently remain at very high altitudes even in winter. Affects desolate stony hillsides, scree fans, moraines and alpine meadows.

Extralimital. Adjacent parts of southern Tibet (Sillem, Ludlow, Sálim Ali, Lavkumar).

GENERAL HABITS. Keeps in pairs or flocks up to 50 birds in summer, in larger flocks in winter. Flies in compact flocks capable of remarkable aerial evolutions, now circling above cliffs in undecided flight, now plunging towards the ground at tremendous speed only to rise again and wheel about while noisily uttering their loud calls (Schäfer). Fond of feeding along the edge of melting snow, on shingle banks of streams or on lake shores, running along the waterline like stints, picking seeds etc. washed up by ripples.

Display. Male wheels and stoops at female and alights on rocks by her side where he stands with outstretched quivering wings like young bird begging for food. Also displays with his tail held high and wings raised at a steep angle, uttering a melodic pink, pink (Schäfer).

FOOD. Seeds (*Artemisia* etc.) and vegetable matter (young shoots of *Sedum*) have been recorded. Also some insects.

VOICE and CALLS. Alarm-note, a harsh, distinctive *churr* rather reminiscent of the note of a grosbeak or stonechat (HW). Loud call-notes given in flight *tuill*, *tuill*, etc. (Schäfer). Song undescribed.

BREEDING. Season, June to August. Nest, a rough cup of grass lined with hair or feathers, placed in a hole under a boulder or in heap of stones. Eggs, 3 or 4, white. Average size of 6 eggs 22.1 × 16.1 mm (Baker).

MUSEUM DIAGNOSIS. No rosy edges on upper wing-coverts but broad ones on rump.

LOCAL NAMES. None recorded.

SIZE. Sparrow; length c. 15 cm (6 in.).

× c. 1

FIELD CHARACTERS. A pale pinkish brown finch with a heavy orange bill.

Male. Above, crown ashy; back greyish brown washed with pink. Wings and lower rump pink; tail dark brown with pale margins. Below, pale greyish pink.

Female similar to male but without pink tinge in winter and only a faint pink flush below in summer.

STATUS, DISTRIBUTION and HABITAT. Uncommon and local resident, subject to seasonal movements. Pakistan in Baluchistan, Sind and N.W.F.P. north to Chitral. Breeding distribution little known; summer records from

Rhodopechys githaginea

▨ Distributional ranges 1 *crassirostris* (2006), 2 extralimital subspecies.

Thal, Saraman, Kalat, Hab Valley, Pishin Valley, Quetta and Chitral. Apparently found mostly in the foothills but in Chitral recorded as high as 3000 m (Fulton) and said to be 'not so common as *mongolica*' (Perreau). More widespread in winter when fairly common in the low hills of Sind and reaching the Makran Coast, Rajasthan (Jaisalmer, Jodhpur), the Salt Range and Punjab (Gurgaon). Affects bare hills and stony semi-desert. Plumage perfectly oblitterative in its accustomed habitat.

154

CARDUELINAE

Young. Crown, sides of head and neck greyish brown. Rest of upperparts like adult but paler, fringes of feathers more tawny. No pink on rump. Underparts like adult but with a slight tawny wash.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	112-122	13-14	20-22	{ 73-82 mm 69-75 mm (HW, Stres.)

156

CARDUELINAE

Extralimital. Extends north to Uzbekistan and west to Israel and central Arabia. Other subspecies in North Africa to Sudan, southern Sahara and Morocco; Canary Islands.

GENERAL HABITS. Keeps in pairs or small flocks according to season. Feeds on the ground, perches on rocks or stones. Avoids perching on bushes. Flight rapid, slightly undulating.

FOOD. Mainly seeds.

VOICE and CALLS. An incessant twittering when in flocks in winter. Call-note rendered as *stand at ease* (Cumming). Song described as a jerky, prolonged tremulous twitter interspersed with bell-like chirping or croaking notes (Dementiev).

BREEDING. Little known. Season, April to June. Nest, a framework of sticks and twigs lined with wool and hair placed in holes in rocks or walls of ruined buildings. Eggs, 4, very pale to deep blue with a few dark spots or a well-defined ring of reddish freckles at the large end. Average size of 14 eggs 18.4 × 14.7 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters. Bill short and very tumid with lower mandible as much curved as upper. Wings long, reaching beyond middle of tail.

Young. Whole upperparts light brown, a little paler on rump and some darker indistinct streaks on mantle. Wings and tail as in adult female but edges and tips of lesser, median and greater coverts yellowish tawny. Centre of breast, belly, vent and under tail-coverts white. Rest as in adult female but suffused with light tawny on sides of body. Postjuvinal moult of body-feathers and apparently all wing-coverts except primary (HW).

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	88-93	12-13	c. 19	51-55 mm (CBT, Baker)
♀♀	83-89			

Weight 1 ♂ juv. (July) 19 g (Fahudan).

COLOURS OF BARE PARTS. Iris brown. Bill of male: scarlet or orange (breeding), dull orange-yellow (winter); female dull yellow. Legs and feet brownish flesh.

2007. **Mongolian Desert Finch.** *Rhodopechys mongolica* (Swinhoe)
Carpodacus mongolicus Swinhoe, 1870, Proc. Zool. Soc. London: 447 (Nankow Fan)
 Baker, FBI No. 1073, Vol. 3: 142
 Plate 101, fig. 14

LOCAL NAMES. None recorded.

SIZE. Sparrow; length c. 15 cm (6 in.).

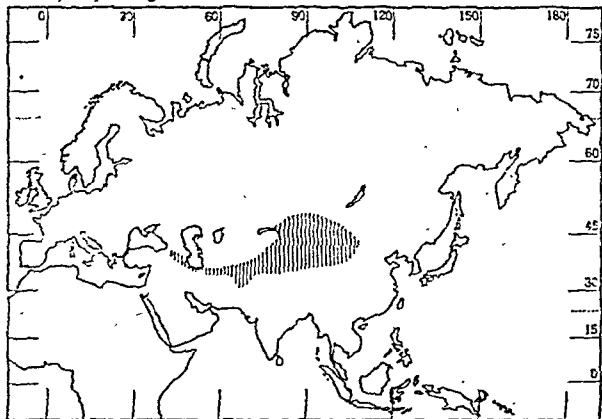

FIELD CHARACTERS. Above, sandy brown with a faint pink tinge on supercilium, wing and lower rump. Tail dark brown with whitish outer edge. Below, greyish brown more or less tinged with pink on chin, throat, breast and flanks; centre of belly whitish. Sexes practically alike, female differing only in having less pink in plumage.

Both sexes rather similar to female *R. githaginea*. Bill of male brownish yellow, not becoming orange or scarlet in summer.

GOLDFINCHES AND ALLIES

157

STATUS, DISTRIBUTION and HABITAT. Fairly common winter visitor (October to May) to Ladakh, Gilgit, Baltistan, Chitral and Quetta, between c. 1500 and 3000 m. Presumably breeds at higher elevations but no actual records. Summer data: Chitral 3000 m in July; Gilgit 2700 and 3000 m in July. *Rhodopechys mongolica*

Distributional range

June; Astor 3300 m in June; Ladakh 3000 m in August; Leh, a juvenile obtained in September; birds observed in Ladakh from 3000 to 3900 m in May but still in flocks. Affects dry stony or rocky slopes and steep ravines.

Extralimital. Extends west to Transcaucasia, north to the Altai and east to Chihli in western China.

GENERAL HABITS. In winter usually seen in flocks of 20 to 30 birds. Very twitter-like in habits, crowding together on bushes or on the ground and keeping up a constant twittering while (Ludlow). Feeds on the ground. Flocks flight regularly morning and evening to drink at desert springs.

FOOD. Seeds of grass etc.

VOICE and CALLS. A constant twittering while in flocks rendered as *tyuk-tyuk* etc. A pleasant song (Dementiev). Call-notes given as *dju-vud* alternating with *djudjuu* (Paludan).

BREEDING. Not recorded within our limits. *Season*, apparently June to August. *Nest*, placed in little hollows on steep ground or under stones.

MUSEUM DIAGNOSIS. Distinguished from *githagina* in being browner above with less or no pink tinge; feathers of crown and back with dark centres, base of crown-feathers brown not ashy. Bill less heavy and swollen. For other differences see Vaurie, 1949, *Amer. Mus. Novit.*, No. 1424: 34.

Young, like adult but upperparts paler sandy brown. Wing-coverts with pale sandy margins. Underparts without pink, sides of body and breast suffused with tawny.

GOLDFINCHES AND ALLIES

159

and foothills up to c. 1400 m. Known to breed only in the Quetta district, elsewhere recorded in winter only. Occurs on breeding ground from March to September though small numbers may also be seen in winter. Affects orchards, fallow fields, weed-overgrown patches, etc.

Extralimital. Ranges west to Israel, north to the Ala Tau and east to central Mongolia, Inner Mongolia and northern Tsinghai.

GENERAL HABITS. Keeps in pairs or small flocks up to 20 or so according to season. Feeds mostly on the ground; perches freely on bushes, trees and telegraph and railing wires.

FOOD. Chiefly seeds and flower buds.

VOICE and CALLS. Call-note *pruii-pruii*; also described as a cheery *pink?*, *pink?*, *pink?*. Song, a little melody comprising repetitions of the call-note, nasal and grating trills and rolls, reminiscent of the Goldfinch, the Linnet and especially the Greenfinch (Erard & Etchecopar, 1970). Song period begins in early March.

BREEDING. *Season*, April (sometimes as early as the first week of March) to July; double-brooded. *Nest*, a compact cup of twigs, sticks and grass well lined with wool, hair or feathers, placed in trees, vines, rose bushes, fruit trees, between one and five metres above the ground. *Eggs*, 5 or 6, sometimes 4 or 7, very pale blue-green to nearly white, marked at the large end with brownish black dots and scrolls, sometimes very sparsely. Average size of 100 eggs 18.9 × 14.2 mm (Baker); of 50 eggs 19.2 × 14.4 mm (Williams). Building of nest by female, accompanied by singing male. A case of brood parasitism by *Cuculus canorus* recorded.

MUSEUM DIAGNOSIS. See Field Characters.

Young. Whole upperparts, sides of head, lesser and median wing-coverts pale sandy brown. Greater coverts brown with pale sandy outer edges and tips. Tertiaries brown washed with pale sandy on both webs; rest of wing and tail as adult. Below, dirty white tinged with sandy brown. Postjuvinal moult of body-feathers, tertiaries and all coverts except primary series (HW).

MEASUREMENTS

brown streaked with darker brown; lower rump pink. Wings largely pink with dark brown tip and a narrow white band at tip of secondaries. Tail dark brown with white outer edge. Below, ear-coverts and throat tawny brown with a few dark brown spots on the latter. Breast and flanks tawny brown streaked with dark brown and a pale band across breast. Centre of belly pinkish white.

Female, similar to male but practically no black on crown and without pink on rump. Pink colour much reduced on wings, and other colours paler.

STATUS, DISTRIBUTION and HABITAT. Status unknown. Two records: Chitral, c. 3000 m apparently in July (Fulton, JBNHS 16: 53) and Ladakh,

Rhodopechys sanguinea

Distributional ranges: *sanguinea* (2009), *aliena* (RE).

c. 3600 m on 27 April (Meinertzhagen, *Ibis* 1927: 381). Affects semi-desert, rocky and scrubby hillsides.

Extralimital. Semi-desert mountain ranges from Turkestan to Turkey and Lebanon. An isolated population (*aliena*) in the Atlas Mts. Recently recorded in southern Spain.

GENERAL HABITS. Keeps in small flocks of 3-5 birds outside the breeding season. The birds from Ladakh (above) were in company with a flock of *R. mongolica* feeding in stubbles near a village.

FOOD. Mostly seeds.

VOICE and CALLS. Call-note uttered in flight *chilip*. A quiet grating song *tkarili...tkurilikip*, reminiscent of the notes of a sparrow, given from

GOLDFINCHES AND ALLIES

161

bushes or tussocks (Lehmann & Mertens, *Oologists' Rec.* 43: 1-16).

BREEDING. Season, May to July. Nest, placed in hollows under a stone or plant on steep slopes. For details see *The Oologists' Record* 43: 1-16, 1969, and *Der Falke* 13: 48-53, 1966.

CARDUELINAE

orchards, scattered scrub on stony plains, and slopes with junipers, briar and rose bushes or other thorny scrub. Winters from c. 1500 m down to the foothills and in the plains of Pakistan south to Sind (rare) and northwestern India south to Londa [Koelz, JBNHS 43: 33 (recorded as *kubanensis* but said to be similar to specimens from the western Himalayas)]. Recorded on passage as high as 5000 metres. Habitat in winter as in 2011.

Extralimital. Ranges north to the Tarbagatai and west to northern Iran.

MIGRATION. Recorded on summer grounds from May to September.

GENERAL HABITS AND FOOD. As in 2011.

VOICE AND CALLS. A short cheery song of five to eight notes like *tree-tree-tweet* or *ti-deu-di-deu*; each individual has its own combination of notes which is invariable, often shared by other birds of its immediate vicinity, but differing considerably in other localities. These various songs do not differ however in character and are always recognizable as belonging to this species (Osmanston). Call-note, a canary-like, interrogative *tree-ee?* or *too-ee?*.

BREEDING. Season, June to September. Nest, a cup of grass lined with rootlets, juniper bark fibre and a few hairs, placed in low bushes of *Lonicera*, briar, rose or willow within a couple of metres from the ground. Eggs, usually 4, sometimes 3, rarely 5, deep blue sparsely blotched with dark brown and black chiefly at the large end, occasionally spotless or with minute specks. Average size of 200 eggs 20.8 × 14.9 mm (Osmanston). Feeding of young by both parents, by regurgitation.

MUSEUM DIAGNOSIS. Male differs from that of *erythrurus* (2013) in being brighter, more scarlet; female darker and more heavily streaked.

Young, like female but edges of feathers on upperparts more ochraceous, giving a more streaked appearance. Wing-bars yellowish white. Streaks on underparts heavier. Postjuvenile moult includes body-feathers and all coverts except primary. Many males breed in brown plumage. Whether all males moult into brown plumage at this moult or whether some moult to red dress is uncertain (HW).

Complete postnuptial moult performed mostly after arrival in the plain in September-October. No prenuptial moult.

MEASUREMENTS

Wing ♂♂ 78-87 mm; ♀♀ 78-84 mm (Dementiev).

Weight 13 ♂♂ (June-July) 20-22; 5 ♀♀ (June) 21-26 g (Paludan).

COLOURS OF BARE PARTS. As in 2011.

2011. **Indian Rosefinch.** *Carpodacus erythrurus roseatus* (Blyth)

Pyrrhula roseata 'Tickell' = Blyth, 1842, Jour. Asiat. Soc. Bengal 11: 461

('sold ... in Calcutta')

Baker, FBI No. 1069, Vol. 3: 137

Plate 102, fig. 3

LOCAL NAMES. *Tūtī*, *Lāl tūtī*, *Sūkhār tūtī* (Hindi); *Gūlābī tūtī*, *Lāl tūtī* (Bengali); *Amonga tūtī* (Nepal); *Chhōid tūtī* (Sylhet); *Tedru-pichilla*, *Tedru-jinawari* (Telugu); *Rosakkūruzi* (Malayalam); *Phalín-pha* (Lepcha); *Dō-di-ma-ro* (Tibetan); *Dejajariaba* (Chachi); *Ingrui* (Naga).

SIZE. Sparrow; length c. 15 cm (6 in.).

FIELD CHARACTERS. As in 2010, q.v.

GOLDFINCHES AND ALLIES

165

STATUS, DISTRIBUTION and HABITAT. Common summer (breeding) visitor to the Himalayas from Garhwal east through Nepal, Sikkim, Bhutan (?) and Arunachal Pradesh (?). Breeds at c. 3900–4000 m in Garhwal, 2700–4200 m in western Nepal (Lowndes), 3700–4000 m in eastern Nepal (Diesselhorst). Affects willows along streams (Garhwal), rock and scrub, sometimes open coniferous forest (western Nepal), bush-covered slopes with isolated birches and firs (eastern Nepal). Winters from c. 1500 m down to the foothills into Assam, Bangladesh and most of the Indian Peninsula.¹ In winter affects openly wooded country, cultivation, scrub and bushes; in southern India up to the highest summits.

Extralimital. Southeastern Tibet and western China, wintering south to the Indochinese countries.

MIGRATION. Arrives in winter quarters in mid September (northern India), October (Maharashtra), November or even December (Kerala). On passage in September, April and May at medium elevations in Nepal, Sikkim, Bhutan and Arunachal Pradesh. Arrives very late on high breeding grounds, e.g. in eastern Nepal where not observed before August (GD).

GENERAL HABITS. Keeps in pairs or in flocks according to season. In the Peninsula often large flocks in company with Blackheaded Buntings. A rather confiding species in the breeding season.

FOOD. Mostly seeds (of weeds, millet, wheat, linseed, vetch, *Polygonum*, bamboo, etc.), flower buds, fruits and berries (mulberry, raspberries, wild cherries, banyan and pipal figs, *Lantana*, *Maesa*, *Trema*). Also nectar of *Erythrina*, *Salmalia*, *Butea*, *Woodfordia* and other blossoms, the forehead- and throat-feathers of the birds often becoming thickly coated with pollen in the quest. Insects recorded once.

VOICE and CALLS. As in 2010.

BREEDING. Season, June to August, mostly July. Nest and eggs, as in 2010. Average size of 100 eggs 20.8 × 14.5 mm (Baker).

MUSEUM DIAGNOSIS. The darkest race. Male deep carmine or purplish in breeding dress attained as the result of wearing off of the paler feather-edges of the postnuptial moult. Female heavily streaked and very dark.

MEASUREMENTS (of winter specimens from the Peninsula, thus including *erythrurus* and possibly the two other subspecies)

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	83–90	13–15	18–20	54–61 mm
♀♀	80–85			51–60 mm (HW, SA)

Weight 2 ♂♂ (Sept.) 24, 24; 1 ♀ (Sept.) 24 g (SDR); 8 ♂♂ (June–Sept.) 21–28; 2 ♀♀ (Sept.) 23–9, 25–3 g (GD); 7 ♂♂ (winter) 22–30 (av. 24.3); 5 ♀♀ (winter) 21–26 (av. 23.6) g—SA.

COLOURS OF BARE PARTS. Iris dark brown. Bill: upper mandible horny, lower silvery grey. Legs and feet dark horny brown; soles dirty white.

¹ Previous to 1939, most winter records from the Peninsula were given as *rustatus* but many presumably pertained to *erythrurus* and/or *ferghensis* or *kubensis* since winter specimens are not identifiable as to the subspecies. Cf. Whistler, *Ibis* 1939: 158–9, Vaurie, *Amer. Mus. Novit.*, No. 1424: 43 and Fleming & Traylor, *Feldiana* 35: 485.

GOLDFINCHES AND ALLIES

167

COLOURS OF BARE PARTS. Iris brown to dark brown. Bill: upper mandible horny or brownish horny, darker on culmen; lower mandible pale horny, darker at tip, greyish on base. Legs and feet horny brown; claws horny.

CARPODACUS NIPALENSIS (Hodgson)

Key to the Subspecies

Males

Paler, less rich in tint.....*C. n. kangrae*
Darker.....*C. n. nipalensis*

2014. Garhwal Dark Rosefinch. *Carpodacus nipalensis kangrae* (Whistler)

Procarduelis nipalensis kangrae Whistler, 1939, Bull. Brit. Orn. Cl. 60: 16

(Dharmasala, Kangra Dist., NW. Himalayas)

Baker, FBI No. 1076 (part), Vol. 3: 146

LOCAL NAMES. None recorded.

SIZE. Sparrow; length c. 15 cm (6 in.).

FIELD CHARACTERS. As in 2013, q.v.

STATUS, DISTRIBUTION and HABITAT. Altitudinal migrant, uncommon. The western Himalayas in Kashmir (Sind Valley, Kishtwar), Dharmasala, Kangra, Garhwal and Kumaon. Affects open forests of oak and rhododendron, bushes and stony pastures near timber-line generally between 3000 and

Carpodacus nipalensis

Distributional ranges

1. kangrae (2014). 2. nipalensis (2015). 3. intensior (RE).

CARDUELINAE

2012. Caucasus Rosefinch. *Carpodacus erythrurus kubensis* Laubmann

Carpodacus erythrurus kubensis Laubmann, 1915, Verh. Orn. Ges. Bayern 12: 93
(Kuban dist., Caucasus)

Baker, FBI No. 1068 (part), Vol. 3: 136

LOCAL NAMES. None recorded.

SIZE. Sparrow; length c. 15 cm (6 in.).

FIELD CHARACTERS. As in 2010, q.v.

STATUS, DISTRIBUTION and HABITAT. A wintering form identified from Nepal (Ripley, JBNHS 49: 412), probably occurring in mixed wintering flocks of rosefinches in India.

Extralimital. Western Iran to the Caucasus and Turkey.

GENERAL HABITS, FOOD and VOICE. As in 2011.

MUSEUM DIAGNOSIS. Similar to *erythrurus* (2013) but somewhat more rosy throughout in males, the pigment usually reaching farther down below and on flanks. A poorly differentiated race (Vaurie). Cf. also Ticehurst, JBNHS 32: 345; Whistler, JBNHS 36: 837.

MEASUREMENTS and COLOURS OF BARE PARTS. As in 2010.

2013. Common Rosefinch or Scarlet Grosbeak. *Carpodacus erythrurus erythrurus* (Pallas)

Baker, FBI No. 1067, Vol. 3: 135

LOCAL NAMES. *Tūti*, *Lāl tūti* (Hindi).

SIZE. Sparrow; length c. 15 cm (6 in.).

FIELD CHARACTERS. As in 2010, q.v.

STATUS, DISTRIBUTION and HABITAT. Winter visitor to the Indian Peninsula and the western Himalayan foothills east to Nepal. Cf. Whistler, *Ibis* 1939: 158–9 and JBNHS 41: 101; Ripley, 1950, JBNHS 49: 412; Rand & Fleming, 1957, *Feldiana* 41: 203; Biswas, 1963, JBNHS 60: 194; also footnote to *C. e. roseus* above (p. 165). Affects cultivation, scrub jungle and open forest, in the Himalayas generally up to c. 1500 m, occasionally 2400 m (Nepal).

Extralimital. From the Baltic Sea to central Siberia, another subspecies ranging thence east to the Sea of Okhotsk.

MIGRATION. 'Vast numbers pour through northwestern India to winter in the Peninsula' (HW). Also recorded on passage in northern Baluchistan. Autumn passage begins in August, lasts through September–October; spring passage in April–May. A bird ringed on 18.iii.1969 near Bharatpur, 27°14'N., 77°28'E. (Rajasthan) was recovered on 16.vi.1969 in the Ulyanovsk region of U.S.S.R. at 53°50'N., 46°21'E.

GENERAL HABITS, FOOD and VOICE. As in 2011.

MUSEUM DIAGNOSIS. The palest race, general colour rosy.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	81–90	14–15	c. 19	56–61 mm
♀♀	78–90			54–59 mm (BB, Rand & Fleming, MD)

168

CARDUELINAE

3600 m, in Garhwal above 3600 m. Obtained in winter at c. 1800 m (Naini Tal), 1500 and 1200 m (lower Dharmasala) after heavy snow-falls.

GENERAL HABITS, FOOD and VOICE. As in 2015.

BREEDING. Little known. The only nest found was said to have been taken in ringal bamboo jungle at c. 4200 m in the second week of August. The three eggs were white, blotched and spotted with rich red-brown with secondary markings of pinkish lavender. They measured: 22.9 × 15.1, 22.2 × 15.3 and 22.3 × 15.3 mm (cf. Baker, *Nidification* 3: 60).

MUSEUM DIAGNOSIS. Like *nipalensis* but upperparts browner, less rich in tint. However see Vaurie, *Amer. Mus. Novit.*, No. 1424: 45.

MEASUREMENTS and COLOURS OF BARE PARTS. As in 2015.

2015. Nepal Dark Rosefinch. *Carpodacus nipalensis nipalensis* (Hodgson)

C. (arduelis) nipalensis Hodgson, 1836, Asiat. Res. 19: 157

(Nepal, central and northern regions)

Baker, FBI No. 1076 (part), Vol. 3: 146

Plate 102, fig. 2

LOCAL NAME. Ka-biya (Lepcha).

SIZE. Sparrow; length c. 15 cm (6 in.).

FIELD CHARACTERS. Male. Above, forehead, forecrown and supercilium vinaceous crimson. A wide band through eye and rest of upperparts dark brown washed with crimson. Below, throat vinaceous pink; a wide maroon band across breast. Flanks dark crimson-brown, belly vinaceous pink; under tail-coverts edged with pale pink.

Distinguished from *C. erythrurus* and *C. rubescens* by absence of red on rump; from all other rosefinches by the darker, maroon band across breast.

Female. Above, dark olive-brown with darker streaks on back and two tawny olive wing-bars. Below, plain olive-brown.

Female distinguished from all rosefinches except *C. rubescens* by unstreaked olive-brown underparts. The very similar *rubescens* ♀ is greyer on belly, has whitish under tail-coverts and some crimson or olive on lower rump.

STATUS, DISTRIBUTION and HABITAT. Fairly common altitudinal migrant. The Himalayas from western Nepal east through Sikkim, Bhutan and Arunachal Pradesh (Ludlow, *Ibis* 1944: 354). Occurs in summer between 3000 and 3600 m in western and central Nepal, 3900–4000 m in eastern Nepal, 3400–4200 m in Sikkim, 3000–4200 m in Bhutan and 3600–4400 m in Arunachal. Winters mostly between c. 2700 and 1800 m, occasionally down to 1400 m (Nepal, Sikkim). In summer affects rhododendron and silver fir forest, grassy slopes with stunted bushes and weeds, rocks and boulders well above the forest zone. In winter affects forest clearings, bushes and cultivation.

Extralimital. Southeastern Tibet. The species extends to Szechuan.

GENERAL HABITS. Keeps in pairs or small flocks. Feeds in bushes or on the ground. Often perches on tops of trees or boulders.

GOLDFINCHES AND ALLIES

169

FOOD. Chiefly seeds and berries. Also nectar of rhododendrons (throat and forehead often coated with pollen).

VOICE and CALLS. A rather wailing, plaintive double whistle, very characteristic (Proud). A single repeated *chaar* and a sparrow-like twitter (Fleming).

BREEDING. Season, apparently about July–August. Nest and eggs unknown.

MUSEUM DIAGNOSIS. See Field Characters and Key to the Subspecies. For distinction from *C. rubescens* female, see 2016 under Museum Diagnosis.

Young hardly distinguishable from female in autumn; dark parts of feathers on mantle more spots than streaks; indistinct dark subterminal bars to crown- and rump-feathers.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	81–95	13–16	20–23	53–66 mm
♀♀	74–90			56–58 mm

(SA, NBK, Rand & Fleming, BB)

Weight 2 ♀♀ (June–July) 22.7, 23.5 g (GD); 4 ♂♂ (Feb.–Mar.) 22–23; 1 ♀ (Feb.) 20 g — SA.

COLOURS OF BARE PARTS. Iris brown. Bill horny brown, paler on lower mandible. Legs, feet and claws horny brown.

2016. **Blanford's Rosefinch.** *Carpodacus rubescens* (Blanford)

Procarduelis rubescens Blanford, 1872 (1871), Proc. Zool. Soc. London: 694, pl. 74 (Sikkim).

Procarduelis rubescens saturator Rothschild, 1922, Bull. Brit. Orn. Cl. 43: 12 (Schwelli-Salween Divide, Yunnan)

Baker, FBI No. 1078, Vol. 3: 148

Plate 102, fig. 1

LOCAL NAMES. None recorded.

SIZE. Sparrow; length c. 15 cm (6 in.).

FIELD CHARACTERS. Male. *Above*, crimson-brown, brighter crimson on head and rump. A double crimson wing-bar. *Below*, rosy red, grey on vent; under tail-coverts edged with white.

Very similar to *C. erythrurus* but lacks contrasting supercilium and dark eye-stripe; throat dull reddish brown; lower belly grey. For distinction from *C. nipalensis* see 2015.

Female. *Above*, olive-brown, with a varying amount of crimson or olive on rump. Two faint wing-bars. *Below*, throat and breast olive-brown; belly grey; under tail-coverts edged with white.

Differs from all female rosefinches (except *C. nipalensis* 2015 q.v.) by unstreaked underparts.

STATUS, DISTRIBUTION and HABITAT. Scarce resident, subject to vertical movements. The Himalayas from central Nepal (Polunin, JBNHS 52: 893) east through Sikkim, Bhutan and Arunachal Pradesh (plentiful both north and south of the main range — Ludlow, *Ibis* 1944: 354). Recorded in

170

CARDUELINAE

Carpodacus rubescens

Distributional range

summer at c. 2700 m in Nepal, 3800 m in Sikkim, 3100–3300 m in Bhutan, 3100–3600 m in Arunachal and southeastern Tibet. Affects conifer or mixed conifer and birch forest. Observed in winter between 1300 and 1300 m in Sikkim, in outskirts of conifer plantation and at c. 2500 m in southeastern Tibet.

Extralimital. Extends to northern Yunnan and southwestern Kansu (Cheng, 1958).

GENERAL HABITS. Keeps in pairs in the breeding season, in flocks up to 30 individuals in winter. Feeds chiefly on the ground.

FOOD. Unrecorded.

VOICE and CALLS. A peculiar persistent clacking note which attracts attention (Ludlow).

BREEDING. Unknown. Season, apparently very early [young just out of nest and adults in breeding condition obtained in mid April (Ludlow)].

MUSEUM DIAGNOSIS. See Field Characters.

Young, like female but without red on rump; throat and breast darker.

Female distinguished from *C. nipalensis* by unstreaked olive-brown back, greyer belly, and in having the rump washed with crimson or olive.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	80–85	13–15	17–18	49–55 mm
♀♀	76–81			49–52 mm

(SA, NBK, Stevens, MD)

COLOURS OF BARE PARTS. Iris dark brown. Bill pale horny brown. Lower mandible paler and yellowish. Legs and feet light brown.

171

2017. **Pinkbrowed Rosefinch.** *Carpodacus rhodochrous* (Vigors)

Fringilla rodochroa [sic] Vigors, 1831, Proc. Zool. Soc. London: 23 (Himalayan Mountains = Simla–Almora area)

Baker, FBI No. 1062, Vol. 3: 129

Plate 102, fig. 4

LOCAL NAMES. *Gulāb tūtī*, *Gulāb chiryā* (Nepal).

SIZE. Sparrow; length c. 15 cm (6 in.).

FIELD CHARACTERS. A smaller edition of the Redmantled Rosefinch (2018) sex for sex.

Male. *Above*, crown and band behind eye crimson-brown. Forehead and supercilium rose-pink. Back streaked with dark brown. Rump rose-pink. A pale wing-bar. *Below*, entirely rose-pink.

Very similar to *C. pulcherrimus* which has the crown streaked with dark brown.

Female. *Above*, olive-brown streaked with dark brown. A conspicuous pale supercilium. *Below*, ochraceous buff streaked with dark brown.

STATUS, DISTRIBUTION and HABITAT. Resident, subject to vertical movements; common in the west, scarcer in Nepal and Sikkim. The Himalayas from western Kashmir east through Kulu, Lahul, Spiti, Garhwal, Nepal,

Carpodacus rhodochrous

Distributional range

Darjeeling and Sikkim. Breeds between 2800 and 3600 m in the west, 3000 to 4200 m in Nepal. Affects open fir and birch forest, willow bushes and dwarf junipers. Winters generally between 1200 and 2400 m, up to 3000 m in Nepal and Sikkim, and down occasionally to 900 m (Nepal) or 600 m in (Rawalpindi, in 'appreciable numbers' — Waite, JBNHS 59: 963). In this

172

CARDUELINAE

season (November to April) affects scrub jungle, open hillsides, grassy slopes and gardens. In Garhwal freely enters upland villages, almost replacing the House Sparrow.

Extralimital. Adjacent parts of Tibet (Sálim Ali, JBNHS 46: 300).

GENERAL HABITS. Keeps in pairs or small flocks according to season. Feeds chiefly on the ground with accentor-like movements.

FOOD. Seeds and berries.

VOICE and CALLS. Call-note, 'a canary-like sweet' (Jones). A sweet lilting song, very characteristic (Proud).

BREEDING. Season, July to September. Nest, a solid cup of twigs, grass, moss and papery birch bark, lined with finer grass and hair, placed in low bushes of juniper, willow, *Lonicera*, etc. or in small firs, generally between 60 and 120 cm above the ground. Eggs, 4 or 5 (Whymper), 5 or 6 (Osmaston), deep greenish blue scantily spotted at the broad end with black spots, occasionally unmarked. Average size of 100 eggs 18.8 × 14.2 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	71–75	c. 13	c. 19	55–62 mm
♀♀	67–71			

(Baker, MD, Vaurie)

Weight 8 ♂♂ (Apr–May) 17–20; 9 ♀♀ 16–18 g — SA. 1 ♂ 19.3; 1 ♀ 18.5 g (GD).

COLOURS OF BARE PARTS. Iris dark brown or reddish brown. Bill dark brown. Legs and feet light brown (in one ♀ fleshy).

2017a. **Vinaceous Rosefinch.** *Carpodacus vinaceus vinaceus* Verreaux

Carpodacus vinaceus Verreaux, 1871, Nouv. Arch. Mus. Hist. Nat. 6 (1870), bull.: 39 (mountains of Chinese Tibet)

Baker, FBI No. 1066, Vol. 3: 133

Plate 102, fig. 7

LOCAL NAMES. None recorded.

SIZE. Sparrow; length c. 13 cm (5 in.).

FIELD CHARACTERS. Male. *Above*, deep crimson, brighter on crown, more rosy on rump. A conspicuous pink supercilium. Wings dark brown with two white spots on tertials. Tail dark brown. *Below*, deep crimson, brighter on belly.

White spots on wing identify the male.

Female. *Above*, olive-brown with indistinct darker streaks and three buff spots on tertials. *Below*, ochraceous olive-brown with indistinct darker streaks.

Similar in coloration to *C. edwardii* female but smaller, less distinctly streaked. Buff spots on wing also identify female.

STATUS, DISTRIBUTION and HABITAT. Accidental? A pair observed at Naini Tal, c. 2500 m, on 9 February 1925 (Meinertzhagen, *Ibis* 1927: 331); one red male collected and several birds seen in November 1970 at Thakola, eastern Dhaulagiri, Nepal, c. 3000 m; a laying female collected in

GOLDFINCHES AND ALLIES

173

Kali Gandak Valley, 3200 m, on 3 July 1973 (Jochen Martens, pers. comm.). Affects dense bushes and clearings in bamboo forest.
Extralimital. Mountains of western China and northwestern Burma. Another subspecies in Taiwan.
GENERAL HABITS. Keeps in pairs or small flocks, frequenting bushes.
FOOD. Unrecorded.
VOICE AND CALLS. A bunting-like *zieh* (Schäfer).
BREEDING. See above.
MUSEUM DIAGNOSIS. See Field Characters.
MEASUREMENTS

	Wing	Tarsus	Tail
♂ ♀	69-71	c. 20	c. 58 mm (Baker)

Bill from skull c. 14 mm
COLOURS OF BARE PARTS. Iris brown. Bill brown, paler at base and on lower mandible. Legs and feet brown.

2018. **Redmantled Rosefinch.** *Carpodacus rhodochlamys grandis* Blyth
Carpodacus grandis Blyth, 1849, Jour. Asiat. Soc. Bengal 18: 810
(Range beyond Simla)

(Burchao Pass, Bend-i-Turkestan Range, western Afghanistan)
Baker, FBI No. 1061, Vol. 3: 128
Plate 102, fig. 13

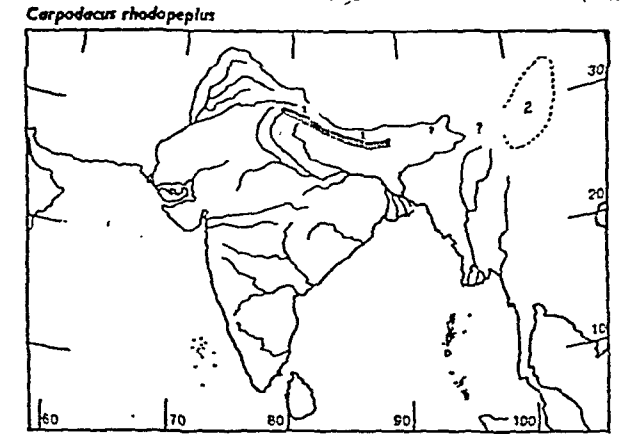

LOCAL NAMES. None recorded.
SIZE. Bulbul ±; length c. 18 cm (7 in.).
FIELD CHARACTERS. Male. *Above*, crown and band behind eye reddish brown. A broad pale pink supercilium. Back pale brown with a pinkish tinge and dark brown streaks. Rump pink. Wings and tail rosy brown. *Below*, throat and sides of head pale pink like supercilium. Rest of underparts rosy red.
Differs from *C. rhodochrous* only by larger size. Male also breeds in brown female-like plumage.
Female. *Above*, ashy brown with darker streaks and a pale supercilium. *Below*, whitish, boldly streaked with dark brown.
The large bill is a good field mark in both sexes.
STATUS, DISTRIBUTION AND HABITAT. Resident, subject to vertical movements, locally common. Pakistan from northern Baluchistan (Ziarat) north to Chitral, thence east through Gilgit, Astor, Baltistan, Ladakh (not recorded in Kashmir proper), Lahul, Spiti, Garhwal and Kumaon (specimen in Brit. Mus.). Breeds between 2700 and 3300 m (Baluchistan, N.W.F.P.), up to 3700 m (Gilgit, Baltistan) and between 3400 and 3800 m in Ladakh and Lahul. Affects juniper, briar rose bushes and other shrubs in dry biotope. In winter (end of October to April) moves down to the foothills (Quetta Valley, Kohat, Salt Range, Campbellpur and Rawalpindi); in Dharmasala, Kangra and Simla recorded in winter between 2200 and 2600 m. In this season affects bushes, wild olive-trees, patches of thorny scrub, gardens and cultivated spots.

175

2019. **Spottedwinged Rosefinch.** *Carpodacus rhodopeplus rhodopeplus* (Vigors)
Fringilla rodopepla [sic] Vigors, 1831, Proc. Zool. Soc. London: 23
(Himalayan Mountains, restricted to Simla-Almora area)
Baker, FBI No. 1063, Vol. 3: 130
Plate 102, fig. 8

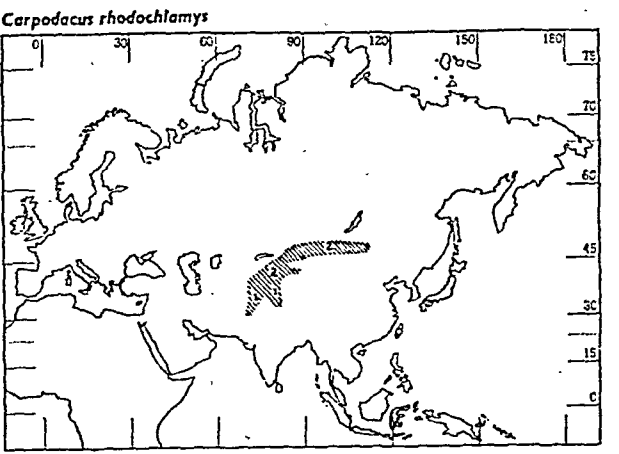

LOCAL NAMES. None recorded.
SIZE. Sparrow; length c. 15 cm (6 in.).
FIELD CHARACTERS. Male. *Above*, crown and band behind eye dark crimson-brown. A shiny, pale pink supercilium. Back crimson-brown with dark brown streaks and pale pink stripes on sides and lower back. Rump pink. Two pinkish buff wing-bars; tertials marked with pinkish white. *Below*, sides of head and throat pale pink. Rest of underparts rosy red.
The pink stripes on back and conspicuous rosy white wing-bars identify the male.
Female. *Above*, ochraceous-brown streaked with dark brown. A conspicuous whitish supercilium. Two pale buffy wing-bars; tertials marked with whitish. *Below*, ochraceous-buff streaked with dark brown.
Pale markings on tertials identify the female (in worn plumage these markings almost disappear). In the distance could be mistaken for a bunting.
STATUS, DISTRIBUTION AND HABITAT. Resident, subject to vertical movements. On the whole a scarce bird and distribution little known. The Himalayas from the hills north of Chakrata and Mussooree (specimens in Brit. Mus.) east through Kumaon (Whymper in Baker's *Nidification* 3: 50),

Distributional ranges 1 *rhodopeplus* (2019), 2 *retersed* (RE).
Record not beyond doubt; whereabouts of specimens unknown.

CARDUELINAE

174

Distributional ranges 1 *grandis* (2018), 2 *extralimital* subspecies.

Extralimital. Northern Afghanistan. The species ranges north to the Altai and Mongolia.
GENERAL HABITS. Keeps in pairs in the breeding season, singly or in small parties in winter. Feeds mostly on the ground, also on low bushes. In common with other rosefinches has a habit of raising feathers of crown, then looking as if crested.
FOOD. Seeds, hips of roses, etc.
VOICE AND CALLS. Call-note a curious, plaintive rather wheezy *kwee* or *squee*. Song undescribed.
BREEDING. Little known. Season, May to July. Nest, cup-shaped, made of grass and bark, lined with fine fibres and a few hairs, placed in low bushes. Eggs, normally 4, pale blue with a few evenly distributed brown spots (Meinertzhagen, *Ibis* 1920: 139; Osmaston, JBNHS 34: 129).
MUSEUM DIAGNOSIS. See Field Characters and Key to the Species.
Young (immature) of both sexes identical with adult female.

	Wing	Bill (from skull)	Tarsus	Tail
♂ ♂	90-96			69-74 mm
♀ ♀	88-92	18-20	20-22	65-70 mm (HW, Vaurie)

Weight 4 ♂♂ (May-July) 31-36; 3 ♀♀ (May-July) 31-35 g — (Paludan).
COLOURS OF BARE PARTS. Iris brown. Bill brown above, pale horn below. Legs and feet brownish flesh.

CARDUELINAE

176

Nepal (Polunin, JBNHS 52: 893; Proud, JBNHS 51: 667, 'very common at 3000-3300 m in May'; Rand & Fleming, *Fieldiana* 41: 206; Diesselhorst, 1968: 387), Sikkim (Mandelli's specimen). Not recorded from Bhutan, Arunachal Pradesh or southeastern Tibet. Breeding zone not known. Non-breeding birds recorded in May at 3000 to 3300 m in central and eastern Nepal. In winter recorded between 2100 and 3000 m; in this season affects grassy hillsides with bushes.

Extralimital. Another subspecies in Szechuan and northern Yunnan.
GENERAL HABITS. Feeds mostly on the ground. Often perches on top of bushes.
FOOD. Seeds.
VOICE AND CALLS. A sweet, far-carrying canary-like chirp (Proud).
BREEDING. Not authentically recorded. See Baker, *Nidification* 3: 50 for possible record.
MUSEUM DIAGNOSIS. See Field Characters.

	Wing	Tarsus	Tail
♂ ♀	82-90	c. 23	67-74 mm (Baker)

Bill from skull 14-15 mm
Weight 1 ♂ (May) 23 g (GD).
COLOURS OF BARE PARTS. Iris brown. Bill horn-brown. Legs and feet pale horn.

CARPODACUS THURA Bonaparte
Key to the Subspecies

	Page
A Palest throughout in both sexes.....	<i>C. t. blythi</i> 176
B Darkest; throat and breast of female brownish.....	<i>C. t. thura</i> 177
C Paler than B; female without brownish on throat and breast.....	<i>C. t. femineus</i> 178

2020. **Kashmir Whitebrowed Rosefinch.** *Carpodacus thura blythi* (Biddulph)
Prospasser blythi Biddulph, 1882, *Ibis*: 283, pl. 9
(Gilgit, 'close to the Indus')
Baker, FBI No. 1056, Vol. 3: 124
Plate 102, fig. 8

LOCAL NAMES. None recorded.
SIZE. Sparrow +; length c. 17 cm (6½ in.).
FIELD CHARACTERS. As in 2021, q.v.
STATUS, DISTRIBUTION AND HABITAT. Common resident, subject to vertical movements. The western Himalayas from N.W.F.P. (Safed Koh and Chitral) east through Gilgit, Kagan Valley, northern Kashmir, Chamba, Lahul (*Amer. Mus. Novit.*, No. 1424: 49) and Garhwal. Breeds mostly between 3000 and 3600 m, in Garhwal to 3900 m (in the Liddar Valley, Kashmir, obtained at 4200 m in August). Affects dwarf juniper and other scrub near and above timber-line. Very few winter data: Simla 2400 m and Kashmir 2100 and 1800 m, in forest on the more open hillsides.

Carpodacus thura

Distributional ranges

1 *blythi* (2020). 2 *thura* (2021). 3 *femininus* (2022).

GENERAL HABITS AND FOOD. As in 2021.

VOICE AND CALLS. A rather loud harsh whistle repeated from 6 to 8 times, somewhat reminiscent of the call of the White-faced Nuthatch (BBO). Rendered as *puit puit* . . . and likened somewhat to screech of Roseringed Parakeet 'especially when a party flies overhead and calls together' (Whitehead). A soft conversational *wid wid* while feeding in company (Jones).

BREEDING. Season, June (Whitehead, *Ibis* 1909: 228), mostly end of July and August. Nest, a large cup of fine grass and moss, lined with hair or fur, placed in low bushes or creeping juniper. Eggs, 3 or 4, greenish blue sparingly spotted at the large end with black. Average size of 16 eggs 22.1 × 16.1 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters. Similar to *thura* (2021) but both sexes distinctly paler throughout. Female less brownish on throat and breast.

MEASUREMENTS AND COLOURS OF BARE PARTS. As in 2021.

2021. **Sikkim Whitebrowed Rosefinch.** *Carpodacus thura thura* Bonaparte & Schlegel

Carpodacus thura Bonaparte & Schlegel, 1850, Monogr. Loxiens: 21, pl. 23 (Himalayas = Sikkim)
Baker, FBI No. 1055, Vol. 3: 123
Plate 102, fig. 10

LOCAL NAMES. None recorded.

SIZE. Sparrow +; length c. 17 cm (6½ in.).

12

STATUS, DISTRIBUTION AND HABITAT. Common resident, subject to vertical movements. Southeastern Tibet and northern Arunachal Pradesh. Altitudinal distribution and habitat as in 2021.

EXTRALIMITAL. Extends east to northern Yunnan and western Szechuan. The species ranges north to Kansu and Ningsia.

GENERAL HABITS, FOOD AND VOICE. As in 2021.

BREEDING. Probably as in 2021.

MUSEUM DIAGNOSIS. Male and female paler than *thura* (2021) though rosy parts in males sometimes slightly deeper in shade. Female very distinct, paler throughout but more heavily streaked, particularly on throat and breast which moreover lacks the brown of female *thura*.

MEASUREMENTS

	Wing	Tail
♂♂	83-88	75-78 mm
♀♀	82-85	73-76 mm
		(NBK)

COLOURS OF BARE PARTS. As in 2021.

CARPODACUS PULCHERRIMUS (Moore)

Key to the Subspecies

Darker; male more vinaceous. *C. p. pulcherrimus*
Paler; male less vinaceous. *C. p. walloni*

2023. **Himalayan Beautiful Rosefinch.** *Carpodacus pulcherrimus pulcherrimus* (Moore)

Propasser pulcherrimus Moore, 1855, Proc. Zool. Soc. London: 216 (Nepal)
Baker, FBI No. 1059, Vol. 3: 126
Plate 102, fig. 5

LOCAL NAMES. None recorded.

SIZE. Sparrow; length c. 15 cm (6 in.).

FIELD CHARACTERS. Male. Above, crown and back ashy brown with dark brown streaks. Stripe behind eye dark brown. A broad supercilium and rump rosy pink. Two indistinct pinkish wing-bars. Below, entirely vinaceous pink or rosy.

Very similar to *C. rhodochrous* but crown streaked with brown. Female. Above, streaked buff and dark brown. A pale, supercilium. Below, buffish streaked with dark brown.

Male often breeds in the brown female-like plumage. STATUS, DISTRIBUTION AND HABITAT. Common resident, subject to vertical movements. The Himalayas from Garhwal east to Bhutan. Breeds between c. 3600 and 4500 m, optimum zone 3800-4200 m. Affects rhododendron and other bushes on steep hillsides near and above timber-line in fairly dry biotope, and in northern and eastern Nepal, terraced cultivation and neighbouring bushes in high valleys. Winters between at least 3600 m down to c. 2100, on open scrub-covered hillsides.

¹ Specimens collected in Chitral by Fulton (JBNHS 16: 52), in BNHS collection, proved to be *C. rhodochrous*.—(S. H. Prater in *epist.* to H. Whistler).

FIELD CHARACTERS. Male. Above, crown and back brown streaked with blackish. Forehead pinkish white. Supercilium pink ending in white. Lores crimson. Stripe behind eye dark brown. Rump rosy pink. Wing brown with a pink bar and a finer white bar. Tail brown. Below, rosy pink, the throat paler and streaked with silky white.

The glistening pink and white forehead, white end to broad pink supercilium, and double wing-bar identify the male.

Female. Above, brown streaked with darker brown. Broad supercilium whitish. A fine whitish wing-bar. Rump golden yellow. Below, buffish streaked with dark brown, darker (pale rufous) on throat.

Males often breed in the brown female-like plumage.

STATUS, DISTRIBUTION AND HABITAT. Common resident, subject to vertical movements. The Himalayas from western Nepal east to Bhutan. Breeds mostly between 3800 and 4200 m. A characteristic bird of the tree-line in light fir, juniper and rhododendron forest or in dwarf rhododendron above timber-line. Winters from at least 3900 m down to c. 2400 m, seldom lower (1900 m, Sikkim). In this season affects open hillsides with barberry or other scrub.

GENERAL HABITS. Usually met with in small loose flocks comprising up to 20 or so individuals. Feeds on the ground, walking and hopping, near or under bushes, sometimes in company with *Mycerobas carnipes* or other species.

FOOD. Berries (*Rubus* etc.), grass- and weed-seeds, vegetable matter, grit. VOICE AND CALLS. A continual loud and rapid piping uttered while feeding on the ground in small parties, rendered as *pupupipipipi* (Desfayes). Song, a linnets-like twitter (Schäfer), seldom heard.

BREEDING. As in 2020. Season, July-August.

MUSEUM DIAGNOSIS. See Key to the Subspecies.

MEASUREMENTS

(Kiympu)

Baker, FBI No. 1057, Vol. 3: 125 (= 'dubius')

LOCAL NAMES. None recorded.

SIZE. Sparrow +; length c. 17 cm (6½ in.).

FIELD CHARACTERS. As in 2021, q.v.

Carpodacus pulcherrimus

Distributional ranges 1 *pulcherrimus* (2023). 2 *walloni* (2024). 3 extralimital subspecies.

EXTRALIMITAL. Adjacent parts of Tibet.

GENERAL HABITS. Usually met with in small parties, feeding on the ground. Easily overlooked owing to its habit of remaining quite still if disturbed. Takes shelter from snow under ledges of rock or beneath eaves of rest-houses. Raises a distinct crest when excited.

FOOD. Seeds and vegetable matter.

VOICE AND CALLS. Call-note, a sparrow-like *cheet-cheet* (A. E. Osmaston). 'Harsh bleating notes' (Smythies). Song undescribed, apparently seldom uttered (cf. Diesselhorst, 1968: 391).

BREEDING. Season, July to September. Nest, a cup of grass, roots and fibres lined with hair or wool, placed about 30 cm above the ground in low shrubs. Eggs, generally 4, sometimes 5, deep blue-green scantily but boldly spotted with black, rarely unspotted. Average size of 100 eggs 19.5 × 14.6 mm (Baker). Incubation apparently by female only.

MUSEUM DIAGNOSIS. See Field Characters. For distinction from *walloni* see 2024.

MUSEUM DIAGNOSIS.

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	74-81	c. 13	c. 20	62-64 mm
♀♀	74-78			

(Rand & Fleming, Sires, NBK, MD)

COLOURS OF BARE PARTS. Iris brown. Bill dark horny brown, lower mandible paler. Legs and feet pale fleshy brown.

GOLDFINCHES AND ALLIES

181

2024. **Tibet Beautiful Rosefinch.** *Carpodacus pulcherrimus waltoni* (Sharpe)

Propasser waltoni Sharpe, 1905, Bull. Brit. Orn. Cl. 15: 95
(Gyantse, S. Tibet)

Baker, FBI No. 1060 (part), Vol. 3: 127

LOCAL NAME. *Do-di* (Tibetan).

SIZE. Sparrow; length c. 15 cm (6 in.).

FIELD CHARACTERS. As in 2023, q.v.

STATUS, DISTRIBUTION and HABITAT. Common resident, subject to vertical movements. Arunachal Pradesh between 3600 and 4500 m, descending to c. 2800 m in winter. Affects rhododendron and other scrub on steep hillsides near or above timber-line in summer, semi-dry hillsides covered with *Quercus illex* in winter.

Extralimital. Southeastern Tibet. The species ranges north to central Mongolia.

GENERAL HABITS, FOOD and VOICE. As in 2023.

BREEDING. As in 2023. Average size of 19 eggs 19 × 14 mm (Ludlow).

MUSEUM DIAGNOSIS. Both sexes paler than in *pulcherrimus*. In males the rosy of underparts is purer and brighter, less vinaceous. Also somewhat larger in size.

MEASUREMENTS

Wing ♂ 76–82 mm (NBK, Stres.)

COLOURS OF BARE PARTS. As in 2023.

2025. **Sikkim Large Rosefinch.** *Carpodacus edwardsii rubicunda* (Greenway)

Erythrura edwardsii rubicunda Greenway, 1933, Bull. Mus. Comp. Zool. Harvard 74: 163
(Su-Wa-Tong, Tibet, Salween-Irrawaddy Divide)

Carduelis edwardsii tongluensis Wolters, 1953, Bonn. Zool. Beitr. 3: 279, new name for
Carpodacus edwardsii saturatus Blanford, preoccupied
Baker, FBI No. 1064, Vol. 3: 131

Plate 102, fig. 6

LOCAL NAMES. None recorded.

SIZE. Sparrow +; length c. 17 cm (6½ in.).

FIELD CHARACTERS. Male. Above, crown and band through eye dull crimson-brown. Forehead and supercilium pink. Back and rump brown washed with crimson, the former broadly streaked with dark brown. A double pinkish wing-bar. Below, throat pale rosy, breast and sides dark rosy, all with fine blackish streaks; centre of belly pink.

The absence of pink on rump identifies the male.

Female. Above, fulvous-brown streaked with dark brown. A conspicuous buff supercilium and a double wing-bar. Below, tawny olive, darker on breast, brighter on lower vent, finely streaked with brown.

More finely streaked below than most female rosefinches.

STATUS, DISTRIBUTION and HABITAT. Rather uncommon resident, subject to vertical movements. The Himalayas from western Nepal (in winter—

182

CARDUELINAE

Rand & Fleming, *Fieldiana* 41: 206 east through Sikkim, Darjeeling, Bhutan and Arunachal Pradesh (Ludlow, *Ibis* 1944: 352). Breeding zone apparently between c. 3400 and 3900 m, in rhododendron and silver fir forest. Winters

Carpodacus edwardsii

Distributional ranges. 1 *rubicunda* (2025), 2 *edwardsii* (RE).

between c. 3700 and 2000 m, rarely 1000 m (western Nepal). In this season frequents rather open forest of rhododendron or birch, and open mountain-sides with ringal bamboo, rose bushes, barberry and other scrub.

Extralimital. Extends east to northern Yunnan and southwestern Szechuan, the nominate subspecies ranging north to Kansu.

GENERAL HABITS. Keeps in pairs or small parties of three or four individuals, rarely more. Feeds on the ground or in low bushes. Seldom flies high into trees. Keeps quite still in cover when disturbed.

FOOD. Mainly seeds (of grass, crab-apples, rice, etc.).

VOICE and CALLS. Undescribed.

BREEDING. Not well authenticated. Altitudes of 14 and 15,000 ft (4200–4500 m) given in *Nidification* 3: 51 seem somewhat too high for the species. See also remark by Ludlow in *Ibis* 1937: 473.

MUSEUM DIAGNOSIS. See Field Characters.

MEASUREMENTS

183

2026. **Threebanded Rosefinch.** *Carpodacus trifasciatus* Verreaux

Carpodacus trifasciatus Verreaux, 1871, Nouv. Arch. Mus. Paris 6, Bull.: 39
(Mountains of Chinese Tibet, restricted to Paohing, eastern Sikang, by Vaurie, 1959, Bds. Pal. Fn.: 637)

Not in Baker, FBI

Plate 102, fig. 9

LOCAL NAMES. None recorded.

SIZE. Bulbul; length c. 17 cm (7 in.).

FIELD CHARACTERS. Male. Above, crown crimson. Forehead and sides of head streaked with silvery white; ear-coverts dark brown. Back crimson streaked with grey. Wings brown with two pink bars and a large white patch on scapulars and tertials. Tail blackish. Below, throat and sides of neck streaked with white. Breast and flanks vinous red, belly white.

Female. Above, dark grey, back streaked with dark brown and olive-yellow; rump olive-yellow. Wings dark brown with two yellow bars and a large white patch on tertials. Below, throat buffish grey; breast ochre-yellow; lower flanks grey with dark streaks; centre of belly buffish.

Wing-pattern identifies both sexes.

STATUS, DISTRIBUTION and HABITAT. Winter visitor to southeastern Tibet [and Arunachal Pradesh (?) along the Tsangpo, between 2000 and 3000 metres, locally very common. Affects orchards and hedges in cultivated fields.

Extralimital. Breeds in western China from northern Yunnan to southwestern Kansu, in light conifer forest.

GENERAL HABITS. Little described. Feeds on trees and bushes. Rather confiding.

FOOD. Crab-apples and cotoneaster berries.

VOICE and CALLS. Unrecorded. A very silent bird in winter.

BREEDING. Unknown.

MUSEUM DIAGNOSIS. See Field Characters. First-winter male like adult male but red parts replaced by orange-yellow.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
4 ♂♂	82–88	15–16	21–22	72–74 mm
1 ♀	82	15	21	71 mm
				(MD)

(Spiti to the Pamirs)

Baker, FBI No. 1071, Vol. 3: 139

Plate 102, fig. 15

LOCAL NAME. *Awel-Isk-si* (Tibetan).

184

CARDUELINAE

SIZE. Bulbul +; length c. 19 cm (7½ in.).

FIELD CHARACTERS. Male. Above, forehead and crown bright red spotted with white. Back pale brown lightly washed with pink, indistinctly streaked; rump pink. Wings and tail dark brown, outer rectrices narrowly edged with white. Below, throat rosy red spotted with white, fading to pink on belly and flanks, the white spotting becoming less distinct.

Female. Above, pale brown streaked with darker brown. Below, whitish with brown streaks.

Male often breeds in brown plumage similar to female's.

Very similar (sex for sex) to *C. rubicilloides* but much paler especially on back which is less heavily streaked. *C. puniceus* which occurs on the same ground is scarlet rather than rosy red, has a wide brown post-ocular stripe and brown lower flanks.

STATUS, DISTRIBUTION and HABITAT. Fairly common resident but locally distributed and parochial, subject to vertical movements. The northern Himalayas from Chitral (Fulton, JBNHS 16: 53) east through Gilgit, Hunza, Ladakh, Lahul, Spiti, Nepal (Diesselhorst, 1968) and Sikkim (*Birds of Sikkim*, p. 376). Breeds between c. 3900 and 4800 m, in eastern Nepal

Carpodacus rubicilla

Distributional ranges. 1 *severtzovi* (2027), 2 *kobensis* (RE), 3 *rubicilla* (RE).

around 5000 m. Recorded in June and July at c. 3300 m in Ladakh. Winter data scanty: recorded as high as 4500 m (Tibet), at 2600 m (Hunza), and exceptionally at 1500 m (Gilgit and Sikkim) after cold spells. Affects boulder-strewn ground at the foot of mountains, often near villages and fields (western Himalayas) and the highest part of the alpine zone with boulders and sparse vegetation, in the same biotope as *C. puniceus* (eastern

GOLDFINCHES AND ALLIES

185

Nepal); also frequents *Caragana* scrub, at least in the non-breeding season, but prefers more desolate rocky country than that frequented by *C. rubicilloides*.

Extralimital. The Tien Shan region in Russian and Chinese Turkestan. Other subspecies in the Caucasus and the Russian and Mongolian Altai. For details see Vaurie, 1959: 643.

GENERAL HABITS. Keeps in pairs or small flocks according to season; sometimes in company with *C. rubicilloides* but more often seen in desolate rocky country devoid of vegetation. Feeds mostly on the ground; in the non-breeding season also on bushes. In flight silhouette very like Horned Lark (*Eremophila*).

FOOD. Chiefly berries and seeds (*Caragana*, green peas, cereals, etc.) and some insects.

VOICE AND CALLS. A loud distinctive call-note (HW) reminiscent of that of *C. rubicilloides* (2028), q.v. Song undescribed.

BREEDING. Not satisfactorily described. *Season*, July and August. *Nest*, known with certainty to be placed in crevices of rock or under stones (Diesselhorst). Nests in bushes described by Dresser (*Ibis* 1904: 109) possibly belonged to *C. rubicilloides* as suggested by his own description of the bird. Other records of breeding in bushes in Tibet (Baker, *Nidification* 3: 56) require confirmation. Cf. also Hume, *Nests and Eggs* 2: 154: nest on the ground in furze bush; eggs greenish with some dark brown spots.

MUSEUM DIAGNOSIS. See Field Characters. Postnuptial moult complete, in August-September.

Young, like adult female but streaks everywhere less defined and sparser. Breast and belly dirty cream colour without streaks; under tail-coverts same colour with dark shafts.

MEASUREMENTS

LOCAL NAMES. None recorded.

SIZE. Bulbul ±; length c. 20 cm (8 in.).

STATUS, DISTRIBUTION AND HABITAT. Resident, subject to vertical movements. Extreme northeastern Ladakh, near Sumdo at c. 3600 m. Habitat as in 2030.

Extralimital. Kirghizstan, Tadzhikistan and southwestern Sinkiang.

GENERAL HABITS, FOOD AND VOICE. As in 2030.

MUSEUM DIAGNOSIS. Paler than *humii* (2030), less heavily streaked and smaller. For details of plumages see Vaurie, loc. cit.

MEASUREMENTS

	Wing	Bill (from feathers)
♂♂	119-122	12-13 mm (Vaurie)

COLOURS OF BARE PARTS. As in 2031.

186

CARDUELINAE

FIELD CHARACTERS. Male. *Above*, forehead, crown and sides of head carmine-red spotted with white. Rest of upperparts grey-brown washed with pink, streaked with darker brown; rump pink. *Below*, carmine-red spotted with white on throat and breast.

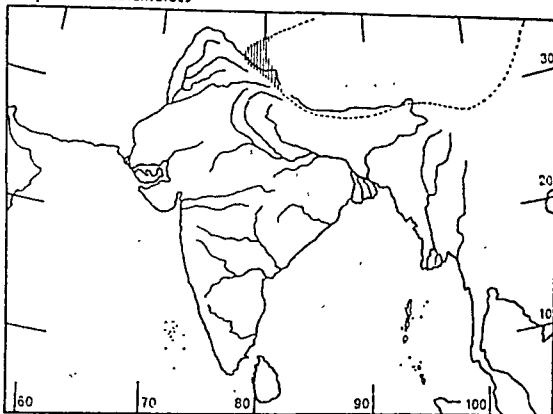

Very similar to *C. rubicilla* (2027) and not reliably distinguishable in the field, but darker, with back distinctly streaked with dark brown. White outer edge of tail very narrow, inconspicuous and often worn off. For distinction from *C. puniceus* see 2027.

Female. *Above*, grey-brown streaked with dark brown. *Below*, buffish with dark brown streaks.

Similar to female *rubicilla* but much darker brown, not sandy brown, above. *C. puniceus* female is practically alike but has an olive-yellow rump.

STATUS, DISTRIBUTION AND HABITAT. Fairly common resident, subject to vertical movements. A bird of the Tibetan plateau and northern Himalayas

Carpodacus rubicilloides

■ Distributional range of *lucifer* (2028).

from Ladakh east to Bhutan. Breeds between c. 3700 and 4800 m, descending in winter to c. 2800 m (Nepal) or 2200 m (southeastern Tibet); in Sikkim observed at 4800 m. Affects *Caragana*, willow and *Hippophae* scrub in arid country.

Extralimital. The Tibetan plateau east to southeastern Szechuan. Another subspecies from central eastern Szechuan to Tsinghai and Kansu.

GENERAL HABITS. Little recorded; apparently much as in *C. rubicilla* but prefers a less desolate type of country. Large numbers (hundreds) observed roosting in willow groves (Ladakh — Meinertzhagen).

FOOD. Chiefly seeds.

188

CARDUELINAE

Carpodacus puniceus

■ Distributional ranges. 1 *kilianensis* (2029). 2 *humii* (2030). 3 *puniceus* (2031). 4 extralimital subspecies.

2030. Western Redbreasted Rosefinch. *Carpodacus puniceus humii*
(Sharpe)

Pyrrhospiza humii Sharpe, 1888, Cat. Bds. Brit. Mus. 12: 433
(Kotegarh; restricted by Vaurie, 1956, Amer. Mus. Novit., No. 1786: 18)
Baker, FBI No. 1054, Vol. 3: 121

LOCAL NAMES. None recorded.

SIZE. Bulbul ±; length c. 20 cm (8 in.).

FIELD CHARACTERS. Male. *Above*, forehead and supercilium bright scarlet. Crown and back grey-brown streaked with darker brown. A brown post-ocular stripe. Rump rosy red. Wings and tail brown. *Below*, throat and breast scarlet mottled with white. Rest of underparts grey-brown.

Distinguished from both *C. rubicilla* and *C. rubicilloides* by scarlet-red, less distinctly spotted with white, broad brown stripe behind eye, and grey-brown lower belly.

Female. *Above*, grey-brown streaked with dark brown. Lower rump olive-yellow. *Below*, cream-buff boldly streaked with dark brown.

Many males breed in brown female-like plumage. Very similar to female *rubicilloides*, distinguished only by yellowish lower rump.

× 1

GOLDFINCHES AND ALLIES

189

STATUS, DISTRIBUTION and HABITAT. Common resident, subject to vertical movements. As in many other rosefinches, red males appear to be in a minority everywhere. The western Himalayas from Gilgit and Kagan Valley east through Baltistan, Ladakh south of the Karakoram, Kashmir (Osmaston, JBNHS 29: 499), Chamba, Kulu, Lahul, Spiti, Garhwal and Kumaon. Breeds well above tree-line between 3900 and 5100 m, mostly above 4200 m. Descends in winter to tree-line, seldom down to 2700 or 2400 m (Kangra, Simla); exceptionally to 1500 m (Gilgit) after cold spells. Affects steep rugged mountainsides, often sharing its typical high-elevation habitat with *Grandala* and *Lerua*.

GENERAL HABITS. Usually met with in small parties of 3 or 4 individuals, feeding among boulders on steep hillsides frequently amongst melting snow. Has a remarkable habit of keeping under cover behind rocks with just its head exposed to keep an eye on the intruder. Occasionally visits high camping grounds in search of food.

FOOD. Chiefly seeds. In summer also buds and the petals of various flowers.

VOICE and CALLS. A metallic sparrow-like chirp uttered on the wing (Matthews), loud and distinctive. 'Call, a cheery bulbul-like *are you quite ready*; male sings short snatches of a soft erratic warbling song' (Whitehead).

BREEDING. Little known. *Season*, July and August. *Nest*, a cup of coarse grass lined with hair, placed on a ledge of a cliff; perhaps also on the ground in Tibetan furze (Stoliczka, JASB 37: 60; may be *C. rubicilla*, cf. Hume, *Nests and Eggs* 2: 154), or in stunted thorn bushes and juniper (Ward in Baker, *Nidification* 3: 43). *Eggs*, deep blue very faintly tinged with green and with a few black spots at the larger end (Ward's eggs). Average size of 7 eggs 24.6 × 17 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters and Key to the Subspecies.

Young, like female and first-winter male but streaking rather less definite. No greenish yellow on rump. Postjuvenile moult of body-feathers, lesser and median coverts.

MEASUREMENTS

FIELD CHARACTERS. As in 2030, q.v.

GOLDFINCHES AND ALLIES

191

STATUS, DISTRIBUTION and HABITAT. Imperfectly known. A very erratic species. The Himalayas from Lahul and Kulu east through Arunachal

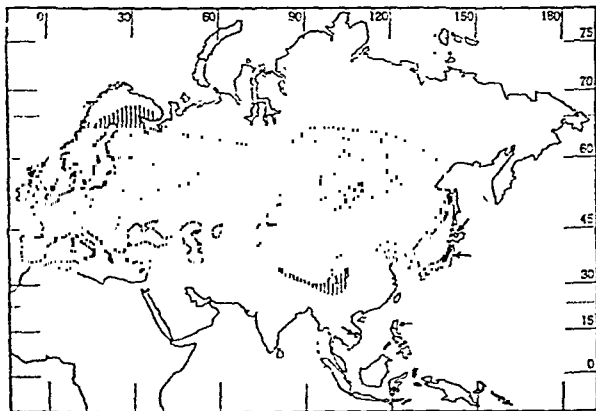

Loxia curvirostra

Fig. 19 Distributional range of the species 1 himalayensis (2032).

Extralimital subspecies not numbered

Pradesh. Data scanty. Recorded between 2700 and 4000 m at all seasons exceptionally descending to 1500 m in winter (Sikkim). Affects conifer forest.

Extralimital. The mountains of western China north to Kansu and Tsinghai. Nominat subspecies extends from eastern Siberia to Scandinavia and Spain. Numerous subspecies in Algeria, Mediterranean islands, Turkestan, Vietnam, Philippines, Manchuria, Japan, North and Central America.

GENERAL HABITS. Usually seen in small restless flocks. Frequents the tops of conifers to extract seeds from the cones with its specially adapted bill, clinging to them in all positions in the quest. Also reported to cut cones off and hold them with one foot against its perch while attacking them. Bill also used like a parakeet's for clambering on the cones. Descends to the ground for grit.

FOOD. Seeds of conifers (fir, spruce, larch, pine). Pips of apples also recorded.

VOICE and CALLS. Series of 3 to 5 *kíp-kíp-kíp-kíp* uttered in flight and when feeding.

BREEDING. Little known for this subspecies. Presumably breeds any month of the year as other subspecies do, depending on fructification of conifers; thus its presence in the winter months in a locality does not necessarily mean it is a winter visitor only. Specimens 'in breeding condition' or with considerably enlarged reproductive organs have been obtained in March (Sikkim) and in May, June and October (southeastern Tibet). A single nest has been found (cf. Baker, *Nidification* 3: 41), no date given. The

190

CARDUELINAE

STATUS, DISTRIBUTION and HABITAT. Common resident, subject to vertical movements. Nepal, Sikkim, Bhutan and Arunachal Pradesh (Ludlow, *Ibis* 1944: 350). Breeds between c. 4200 and 5200 m, in eastern Nepal mainly above c. 4900 m. Noted in winter between 4800 and 2700 m. Affects steep rocky and boulder-strewn slopes in the alpine zone.

Extralimital. Southern Tibet. The species extends to Szechuan, Kansu and Tsinghai.

GENERAL HABITS, FOOD and VOICE. As in 2030.

BREEDING. Unknown.

MUSEUM DIAGNOSIS. Differs from *hamii* in being darker, more heavily streaked and smaller.

MEASUREMENTS

(Lichiang Range, Yunnan)

Baker, FBI No. 1052, Vol. 3: 119

Plate 102, fig. 14

LOCAL NAMES. None recorded.

SIZE. Bulbul; length c. 20 cm (8 in.).

FIELD CHARACTERS. Male. Above, forehead and supercilium crimson. Crown, nape, sides of neck, and back brown washed with dull crimson. Shoulder and wing-bar reddish. Rump crimson. Below, throat and breast crimson with whitish spots. Rest of underparts grey.

Female. Above, forehead and supercilium orange-yellow. Crown and back scalloped brown and olive. Nape and sides of neck olive. Rump yellowish olive. Below, throat and breast yellow with dark mottling. Rest of underparts grey.

STATUS, DISTRIBUTION and HABITAT. Resident, subject to vertical movements, rather uncommon. The Himalayas from central Nepal east through Sikkim, Bhutan and Arunachal Pradesh, thence (winter only?) south in the eastern ranges to the Cachar and Khasi Hills and Manipur. Occurs in summer between c. 3500 and 4200 m, in winter between c. 1800 m (rarely) and at least 3600 m. Affects thick rhododendron, juniper and willow scrub near timber-line, and light forest with dense bush undergrowth.

Proprhula subhimachala

Distributional range

Extralimital. Extends to northern Yunnan and southwestern Szechuan.

GENERAL HABITS. A quiet bird, rather confiding but easily overlooked. Forages in low berry-laden bushes. Collects in small flocks in winter.

FOOD. Seeds (of pine etc.), berries (of *Viburnum*, *Berberis* and others), crab-apples and vegetable matter (probably buds).

VOICE AND CALLS. A sparrow-like chirruping note but quite melodious (Meinertzhagen). Subdued warbling notes something like a canary, *terp*, *terp*, *tee* (Fleming).

BREEDING. Unknown.

MUSEUM DIAGNOSIS. See Field Characters.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	92-110	13-18	21-25	74-83 mm
♀♀	91-97			74-79 mm

(NBK, Rand & Fleming, SDR, MD, SA)

Weight 3 ♂♂ (Feb.) 44-48; 3 ♀♀ (Feb.) 44-50 g — SA, BB. 3 ♂♂ (July-Aug.) 42-54-48; 1 ♀ (Aug.) 48-8 g (GD).

COLOURS OF BARE PARTS. Iris hazel brown. Bill: upper mandible blackish, lower pale-horny darker at tip. Legs and feet brownish horny.

Genus HAEMATOSPIZA Blyth

Haematospiza Blyth, 1845 (1844), Jour. Asiat. Soc. Bengal 13: 950.

Type, by monotypy, *H. boetonensis* Blyth = *Corythus Sipahi* Hodgson

Wing long, reaching beyond the middle of the tail which is rather short. Bill like that of *Proprhula* but larger. Plumage of male scarlet, of female olive and brown, scalloped. Closely allied to *Proprhula* and *Pinicola*.

13

Bhutan foothills and the Sikkim and Jalpaiguri duars, c. 600 m. Affects open forest of pine and other conifers; in winter also oak forest.

Extralimital. Ranges east to northern Yunnan.

GENERAL HABITS. Keeps singly or in scattered flocks of up to 25 birds or more often in mixed parties of small birds. Feeds in low berry-laden bushes as well as high up in trees. Also searches for insects under moss covering the branches. Flight finch-like, strong and dipping, with rapid wing-beats.

FOOD. Seeds, berries, flower buds and other vegetable matter, and some insects.

VOICE AND CALLS. A pleasant *too-tee* reminiscent of the Large Cuckoo-Shrike (*Coracina*), but rather softer and higher pitched (SA); a rather creaky *kwee-i-u* not unlike the notes of a canary (Lister).

BREEDING. Little known. Season, in the Khasi Hills May and June. Nest, a bulky cup of twigs and coarse roots, lined with finer rootlets, a little hair, wool or dried moss; placed in forks in pine trees between c. 7 and 12 metres above ground level. Eggs, not well authenticated, blue with small red-brown blotches forming a ring or cap at the large end. Four eggs vary in size from 22.1 × 17.3 and 23.2 × 17 to 25.4 × 18 mm (cf. Baker, *Nidification* 3: 41-2).

MUSEUM DIAGNOSIS. See Field Characters. Body-feathers white at base (except on lower back and lower belly) in both sexes. First-year male like female.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	98-108	16-20	19-22	63-70 mm
♀♀	95-102	mostly 18-19		60-66 mm

(SA, BB, Stevens)

Weight 2 oo? (Sept.-Oct.) 38, 38 g (SDR). 1 ♂ (March) 42.5; 2 ♀♀ (March, Oct.) 39, 40 g — SA.

COLOURS OF BARE PARTS. Iris brown or hazel brown. Bill ♂ brownish yellow or brownish flesh, with a pale crimson flush when fresh; ♀ without flush. Legs, feet and claws horny brown.

MISCELLANEOUS. Fat of scarlet males noted by SA to be the same colour as feathers; only somewhat less brilliant.

Genus PYRRHOPLECTES Hodgson

Pyrrhoptes Hodgson, 1844, in Gray, Zool. Misc.: 85. Type, by monotypy,

Pyrrhula ? *Epauletta* Hodgson

Bill reminiscent of *Pyrrhula* but less swollen, flatter than that of *Corpodacus* with which it generally corresponds. Second primary (as.) much shorter than third. Inner webs of tertials white.

2035. Goldheaded Black Finch. *Pyrrhoptes epauletta* (Hodgson)

SIZE. Bulbul ±; length c. 18 cm (7½ in.).

× c. 1

FIELD CHARACTERS. Male. Brilliant scarlet overall with brown wings and tail and a darker line through eye. Bill yellow.

Female. Above, dark brown scalloped with yellowish olive. Rump bright yellow. Below, dark brown scalloped with olive on throat and with greyish on breast.

STATUS, DISTRIBUTION AND HABITAT. Resident, subject to vertical movements, rather uncommon. The Himalayas from central Nepal (Biswas, JBNHS 60: 199;

Fleming & Traylor, *Fieldiana* 53: 190) east through Darjeeling, Sikkim, Bhutan and Arunachal Pradesh, thence south in the eastern ranges to

Haematospiza sipahi

Distributional range

Cachar, Khasi Hills and Mt Victoria. Breeding zone imperfectly known. Recorded at 2300-2400 m in summer in Bhutan, and in May in the Nepal duns. In the Khasi Hills breeds between c. 1600 and 2000 m; on Mt Victoria at 2500-3000 m in May. Most records of the bird are in the non-breeding season when it has been observed from 2400 m down to the

FIELD CHARACTERS. Male. Above, crown orange-yellow. Rest of upperparts dull black with white on inner web of tertials showing as a distinctive white line on wing. Below, dull black, centre of belly and axillaries ochraceous.

Female. Crown grey tinged with yellow; rest of upperparts brown. White line on wing as in male. Below, paler brown, axillaries ochraceous buff.

STATUS, DISTRIBUTION AND HABITAT. Resident, subject to vertical movements, fairly common. The Himalayas from Simla (Cat. Bds. Brit. Mus. 12: 386-7) east through Nepal (Biswas, JBNHS 60: 198; Fleming & Traylor, *Fieldiana* 35: 485), Darjeeling, Sikkim, Bhutan and Arunachal Pradesh

Pyrrhoptes epauletta

Distributional range

(Ludlow, *Ibis* 1944: 348). Occurs in summer between c. 2800 and 3900 m, in winter (October to April) between 1400 and 3600 m. Affects rhododendron and ringal bamboo undergrowth in summer, most plentiful in the rhododendron zone. In winter frequents low scrub, dense thickets and bushes in forest.

Extralimital. Ranges east to northern Yunnan and southwestern Szechuan.

GENERAL HABITS. In winter keeps in small flocks of three to six birds, sometimes in company with rosefinches. Feeds on bushes or on the ground. Like bullfinches, keeps very still and unobtrusive when feeding on bushes.

FOOD. Chiefly seeds and berries; also some insects.

VOICE AND CALLS. Call-note a high-pitched *peu peu*, very distinctive (Smythies); also described as a squeaky whistle not unlike that of the

GOLDFINCHES AND ALLIES

197

Bullfinch, *Pyrrhula pyrrhula* (Meinertzhagen). Song (?), a low musical pipe (Ludlow).

BREEDING. Unknown.

MUSEUM DIAGNOSIS. See Field Characters.

Baker, FBI No. 1045, Vol. 3: 111

Plate 103, fig. 7

LOCAL NAME. *Kebya* (Lepcha).

SIZE. Sparrow +; length c. 17 cm (6½ in.).

FIELD CHARACTERS. Male. Above, area round base of bill, lores and round eye black; forecrown and spot below eye white. Crown and back grey; rump white. A black shoulder-patch and a paler grey wing-patch; rest of wing and tail glossy purple-black. Below, chin black; throat grey; breast, upper belly and flanks orange-red to red; lower belly ashy; under tail-coverts white.

Female. Above, like male but back brown. Below, wholly brown, under tail-coverts white.

White forecrown distinguishes female from *P. nipalensis*.

STATUS, DISTRIBUTION and HABITAT. Resident, subject to vertical movements, locally common. Darjeeling, Sikkim, Bhutan and Arunachal Pradesh

198

CARDUELINAE

STATUS, DISTRIBUTION and HABITAT. Resident, subject to vertical movements, fairly common locally. The Himalayas from Dharmasala (c. 76° 30' E.) east to Arunachal Pradesh. Occurs in summer between c. 2100 and 3000 m,

Pyrrhula nipalensis

Distributional ranges 1 *nipalensis* (2036), 2 *ricketti* (2037), 3 extralimital subspecies.

locally down to 1800 m (Bhutan), exceptionally up to 3900 m in Sikkim (Schäfer in Salim Ali, 1962). Descends to c. 1500 m in winter. Affects dense fir, oak and rhododendron forest.

GENERAL HABITS. Keeps in pairs or small flocks of six to twelve birds according to season. Arboreal; forages rather high up in trees. Flight swift and direct.

FOOD. Presumably as in other bullfinches, q.v. Nectar of rhododendron flowers, and berries recorded (SA).

VOICE and CALLS. Call-note, a mellow *pearl-lee*, more melodious than that of Redheaded Bullfinch. A continuous soft whistling twitter while feeding (Proud). For description of song see 2037.

BREEDING. Unknown (records not well authenticated, cf. Baker, *Nidification* 3: 40).

MUSEUM DIAGNOSIS. See Field Characters and Key to the Subspecies.

Young, like female but head not scaly. Upper tail-coverts not glossy, and tipped with brown. Back, throat and breast more tawny.

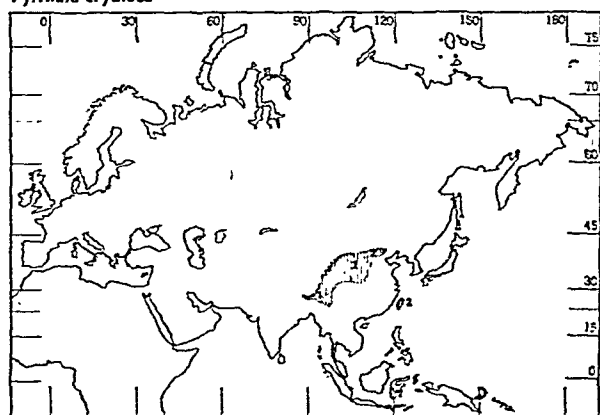

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail

200

CARDUELINAE

(Ludlow, *Ibis* 1944: 205). Occurs in summer between c. 2500 and 3800 m, in winter between c. 2000 and at least 3200 m, occasionally down to c. 1700 m (Darjeeling, SF 2: 455). Affects conifer and rhododendron forest, also willow and buckthorn thickets.

Pyrrhula erythraea

Distributional ranges. 1 *erythraea* (2038), 2 extralimital subspecies.

Extralimital. Extends east to Yunnan, north to Kansu and Shensi; other subspecies to Hupeh and in Taiwan.

GENERAL HABITS. Similar to other bullfinches. Keeps in pairs or small flocks according to season. Feeds among bushes or on the ground.

FOOD. Seeds, buds (of willow, buckthorn, juniper, etc.), insects and pupae. Nectar of rhododendron flowers (SA).

VOICE and CALLS. 'A triple whistle' (Stanford). Other notes undescribed.

BREEDING. Little known. One nest described as 'the usual frail bullfinch type about twelve feet [3.6 m] from the ground on top of a young pine tree. It contained young birds about a week old' on 19 July (Ludlow).

MUSEUM DIAGNOSIS. See Field Characters.

Young, much as female but crown suffused with olive. Greater coverts with comparatively narrow ashy white tips. Postjuvinal moult of body-feathers and all coverts except primary series.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	80-86	11-13	16-18	67-73 mm
♀♀	80-85			66-74 mm (NBK, Mayr, MD, SA)

Weight 1 ♂ imm. (Feb.) 18; 1 ♀ (Feb.) 20 g—SA.

COLOURS OF BARE PARTS. Iris brown to dark brown. Bill black (♂); dark brown (♀). Legs and feet fleshy brown to horny brown.

2039. **Redheaded Bullfinch.** *Pyrrhula erythrocephala* Vigors

Pyrrhula erythrocephala Vigors, 1832, Proc. Zool. Soc. London: 174

(Himalayan Mountains = Sin'la-Almora area)

Baker, FBI No. 1044, Vol. 3: 110

Plate 103, fig. 6

LOCAL NAME. *Kobyu* (Lepcha).

SIZE. Sparrow +; length c. 17 cm (6½ in.).

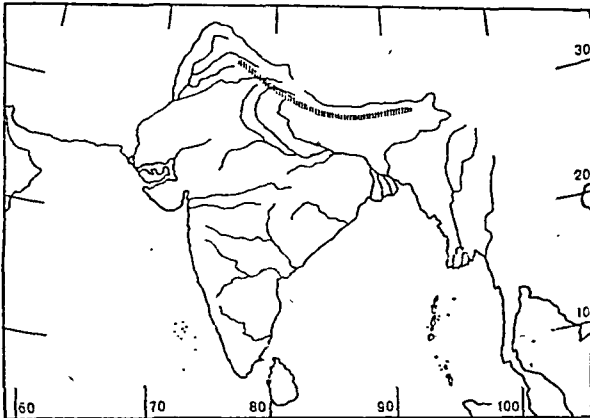

FIELD CHARACTERS. Male. Above, area around base of bill and eye black. Crown red; back grey; rump white. Wings glossy purplish black with a large ashy patch. Tail (noticeably forked) glossy purplish black. Below, chin black; throat, breast and flanks dull rusty red. Lower belly ashy; under tail-coverts white.

Female, like male but crown yellowish olive. Back and underparts brown.

STATUS, DISTRIBUTION AND HABITAT. Resident, subject to vertical movements, fairly common.

The Himalayas from Kashmir (rare) east at least to eastern Bhutan (Ludlow, *Ibis* 1944: 206). Breeds between c. 2400 and 3300 m in the western part of its range, 2700–3600 m (Garhwal), 3400–4200 m (central and eastern Nepal),

Pyrrhula erythrocephala

Distributional range

GOLDFINCHES AND ALLIES

with an olive tinge; rump white. Wings black with a whitish buff patch. Tail black, slightly forked. Below, ochraceous orange-yellow (or saffron yellow).

Female, like male but crown, nape and ear-coverts grey. Back and breast yellowish brown. Belly dull yellow.

STATUS, DISTRIBUTION AND HABITAT. Common resident, subject to vertical movements. The western Himalayas from Chitral, Astor, Gilgit and Murree east through Kashmir (very common) to Simla. Breeds between c. 2700 and

Pyrrhula aurantiaca

Distributional range

3300 m (timber-line), in open fir, birch and mixed forest.¹ Descends in winter to c. 1600 m.

GENERAL HABITS. Keeps in pairs or in small flocks comprising up to ten birds or so. A quiet and unobtrusive species. Feeds in bushes or on the ground.

FOOD. Seeds, berries and buds (of willow, cherry, etc.).

VOICE AND CALLS. Call-note, a soft, clear low-pitched *tew* which first betrays their presence in a locality. Song, very distinctive: commencing with a loud melodious *tew* followed by a rapidly repeated metallic trisyllabic note like *tyätlinkä-tlinkä* (Magrath).

BREEDING. Season, June to August. Nest, a cup of fine twigs and rootlets, lined with moss, rootlets and a few hairs, placed in saplings or in the lower branches of large trees. Eggs, 3 or 4, white blotched with dark reddish brown mostly at the large end. Average size of 13 eggs 21.3 × 15 mm (Baker). Building of nest by female, accompanied by male.

¹ Nests said to have been found on the Kolahoi Mtn., Kashmir, 'between 12,000 and 13,000 feet' (Ward, JBNHS 18: 462); these altitudes are much too high as they seem to be well above timber-line beyond which this bullfinch is not known to occur. The nests had been obtained by native collectors. Cf. also JBNHS 21: 1307.

3300–3900 m (Sikkim) and 2700–3800 m (Bhutan). Descends in winter regularly to c. 1500 m; occasionally 1200 m (Chamba) or 1000 m (Sikkim); in Nepal not recorded below 2100 m. Does not entirely leave the higher zone: has been recorded in December as high as 3900 m (Nepal, Sikkim). A bird of the deciduous forest, especially birch; also found in willow and rhododendron forest. In winter frequents mostly rhododendron either in pure stands or in oak or conifer forest; also willows along banks of streams.

Extralimital. Adjacent parts of southeastern Tibet.

GENERAL HABITS. Usually seen in small flocks of five to seven birds, feeding mostly among bushes, sometimes on the ground.

FOOD. Chiefly seeds (of birch, *Rumex*, etc.). Also leaf buds, willow catkins, and various berries [blackberries (*Rubus*), strawberries]. Nectar of flowers, e.g. rhododendron.

VOICE AND CALLS. Call-note a soft plaintive whistle *phew-phew*, indistinguishable from that of the European bullfinch (various observers). Also a faint, mellow call (song?) *cher-peri* (Fleming).

BREEDING. Season, mainly August. Nest, a cup of twigs, beard-moss (*Usnea*) lined with roots, placed in small trees three metres or so above ground level. Eggs, 3 or 4, dull grey-white faintly tinged with green, marked with brown or red-brown specks and small blotches with secondary similar marks of dark grey and pale lavender; markings distributed as a ring round the large end and sparsely scattered over rest of surface. Average size of 13 eggs 20.8 × 14.7 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters.

Young. Above, pale rufous-brown, brighter on crown, tinged grey on back. Lesser and median coverts grey tipped with rufous; greater coverts black tipped with rufous-grey. Below, belly greyish; under tail-coverts white; rest of underparts warm brown. Rest of wing and tail as in adult. Postjuvinal moult of body-feathers, lesser, median and greater coverts.

MEASUREMENTS

(Kastek, Semirechia)

Baker, FBI No. 1137, Vol. 3: 218

Plate 104, fig. i

LOCAL NAMES. None recorded.

SIZE. Bulbul; length c. 18 cm (7 in.).

FIELD CHARACTERS. Reminiscent of female House Sparrow, but larger and dumper. *Above*, greyish brown streaked with dark brown. *Below*, sides of neck and throat cream coloured becoming greyish white on belly, streaked with dark brown, more heavily so on breast. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Winter vagrant, recorded once in Jhang district, Pakistan, in November and December (Whistler, JBNHS 25: 742). Affects waste ground and arable land.

EXTRALIMITAL. Ranges from Turkestan and Afghanistan to the British Isles and Morocco.

GENERAL HABITS. In small flocks in winter, hopping and feeding on ground, perching on bushes, telegraph wires, etc. Undulating sparrow-like flight.

FOOD. Seeds, rice grains, etc. and insects.

VOICE and CALLS. Call-note a distinctive *tit*.

BREEDING. Extralimital.

MUSEUM DIAGNOSIS. See Field Characters and Key to the Species; for details of plumages (and bionomics), Withersby, 1938, 1: 112.

Weight 1 ♀ (March) 27 g — Paludan. 4 ♂ ♀ (April) 27-29 g — SA.

COLOURS OF BARE PARTS. Iris brown. Bill: upper mandible dark horny brown, lower plumbeous (Abbott), bluish horny or yellowish horny (Hume). Legs and feet brownish flesh.

2043. Blackheaded Bunting. *Emberiza melanocephala* Scopoli*Emberiza melanocephala* Scopoli, 1769, Annus I, Hist. Nat.: 142 (Carniola)

Baker, FBI No. 1133, Vol. 3: 213

Plate 104, fig. 12

LOCAL NAMES. *Gāndām* (Hindi); *Zārdan drūshk* (Baluchi); *Booree* (Sindhi = 'deaf', as no amount of shouting will scare them from the crops!).

SIZE. Sparrow +; length c. 18 cm (7 in.).

FIELD CHARACTERS. Male. *Above*, crown and sides of head black; back and rump rufous. A whitish double wing-bar. *Below*, lemon-yellow, sides of breast rufous.

Female. *Above*, fulvous-brown with dark streaks. *Below*, buffish white with traces of yellow; sides pale brown, under tail-coverts yellow. Difficult to distinguish from ♀ *bruniceps* unless in the hand. See Museum Diagnosis.

STATUS, DISTRIBUTION and HABITAT. Abundant winter visitor to western and central India in Rajasthan, Gujarat, Madhya Pradesh (east to Saugor, once to Lohardaga in Bihar), Maharashtra (east to Nagpur and Nander) and Karnataka (south to Hiriyur). Recorded on migration in Punjab, Kangra, Gilgit, Peshawar and in large numbers in Sind and Baluchistan. Once in Kathmandu Valley, Nepal (Fleming, JBNHS 68: 834). Affects cereal cultivation.

EXTRALIMITAL. Breeds in Iran, the Middle-East, Caucasus, southern Russia and the Balkans.

MIGRATION. Found in winter quarters from September to early April. Autumn passage August-September (earliest 2 August); spring passage March-April. In spring males tend to migrate in almost pure flocks passing through earlier, the females apparently passing through later and quicker and thus tending to escape notice. Direction of migration northwest-southeast; a bird ringed in Kutch (c. 23°N., 69°E.) on 26.ix.1959 was recovered on 26.v.1961 in Krasnodar dist. (c. 45°N., 40°E. — USSR) c. 3700 km NW. Another ringed in Kathiawar (c. 22°N., 71°E.) on 22.ix.1964 was recovered on 16.v.1965 in Cyprus (c. 35°N., 34°E.) c. 4500 km in the same general trend.

The extreme known distance between the breeding grounds and the winter quarters of this bunting, *ride* Stresemann (1944, Orn. Monatsb. 52: 85-92), is c. 7000 km. A ringed bird has been ascertained to have flown

EMBERIZIDAE

206

Bill from skull c. 17 mm (MD).

Weight 1 ♀ (Nov.) 1½ oz. (39 g) — HW.

COLOURS OF BARE PARTS. Iris dark brown. Bill yellow, dark horn on culmen. Legs and feet straw-yellow.

2042. Pine Bunting. *Emberiza leucocephala leucocephala* S. G. Gmelin¹*Emberiza leucocephala* S. G. Gmelin, 1771, Nov. Comm. Sci. Petropol. 15: 480, pl. 23, fig. 3 (Astrakhan)

Baker, FBI No. 1123, Vol. 3: 202

Plate 110, fig. 3

LOCAL NAMES. None recorded.

SIZE. Sparrow +; length c. 17 cm (6½ in.).

FIELD CHARACTERS. Male. *Above*, centre of crown white; forehead and sides of crown blackish; a broad chestnut supercilium; cheeks white. Back rufous-brown streaked with dark brown; rump rufous. Two pale wing-bars. Tail dark brown with white outer rectrices. *Below*, chin and upper throat chestnut; lower throat white, this colour extending as a narrow collar to sides of neck. Breast and flanks rufous, lightly streaked; centre of belly whitish.

In winter centre of crown ashy instead of white, and chestnut parts largely with white margins to the feathers.

Female, lacks chestnut on face. *Above*, crown and sides of head brown with dark streaks. Cheeks whitish, a narrow black streak below. Rest of upperparts as in male. *Below*, breast and flanks rufescent with dark streaks, rest white.

STATUS, DISTRIBUTION and HABITAT. Common winter visitor to Pakistan and northwestern India from N.W.F.P. south to Quetta and east through the Punjab plains, Gilgit, Kashmir and the foothills east to west-central Nepal (Pokhara c. 84°E.) — Proud, JBNHS 58: 278. Affects bush-covered grassy slopes and cultivation, especially fallow and stubble fields; in the hills normally up to c. 1500 m, occasionally to nearly 2700 m (Simla).

EXTRALIMITAL. Breeds in Siberia from the Ob river east to the Lena river and Sakhalin Island. A subspecies in Tsinghai and eastern Kansu. Winters to China and Iran.

MIGRATION. Arrives mostly in November, remains until March, sometimes April. Recorded on passage on Burzil Pass in November.

GENERAL HABITS. In winter keeps in flocks, often with *E. cia*, sometimes with finch-larks, *Eremopterix grisea* (818). Feeds on the ground, perches in trees.

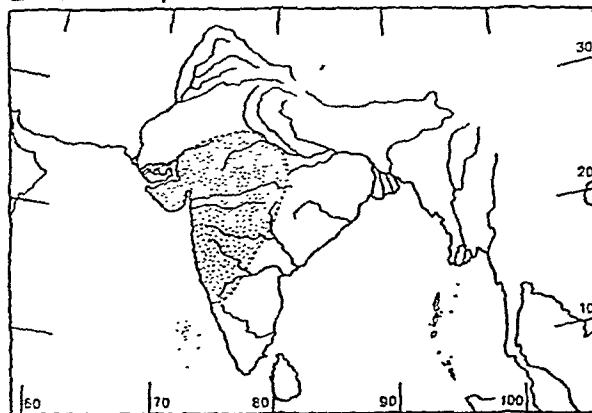

FOOD. Grass seeds, grain (mostly rice when opportunity offers); insects. VOICE and CALLS. Call-note a single sharp *zilt* or *pit*; easily distinguishable from that of *E. cia stracheyi* (2052). 'Exactly like Yellow Bunting [*E. citrinella*]' (A. E. Jones).

¹A hybrid *leucocephala* × *citrinella* has been obtained at Urak, northern Baluchistan, in April 1924 (Ticehurst, JBNHS 31: 867).

EMBERIZIDAE

208

c. 1000 km in 7 days. Thus, hypothetically, such an extreme migrant would spend about 48 days on passage each way (total 96 days). About 90 days are normally spent on the breeding grounds, and the remaining half-year — 180 days — in the winter quarters in India!

Emberiza melanocephala

Winter range

GENERAL HABITS. Keeps in flocks, often huge mixed swarms with Red-headed Buntings, feeding along cross-country cart tracks and grain fields, sometimes causing serious damage to standing crops. On disturbance by the cultivator's frantic shouts and scaring slings the swarm merely flies onto the surrounding trees, looking in the distance like a flush of bright yellow blossoms. The birds return almost immediately to resume their depredation. In such flocks a very large preponderance of yellow males has been noted. Large numbers also flock to feed from ricks of paddy, bajra, etc. stacked in fields after harvesting. Enormous concentrations roost in thorn scrub and thickets in company with House and Yellowthroated Sparrows.

FOOD. Chiefly grass seeds and cereal grains — rice, wheat, jowar, bajra, etc.

VOICE and CALLS. Only call-note in winter a musical *treeet*. Loud, pleasant whistling song of male sometimes heard before departure in spring.

BREEDING. Extralimital.

MUSEUM DIAGNOSIS. See Field Characters. Female differs from ♀ *bruniceps* in being larger (cf. Measurements) and in the rump being tinged with rufous (i.e. yellow).

This species, like *E. bruniceps*, has two moults each year; unlike other *Emberiza* (and all other oscines) the flight-feathers are renewed during winter moult into breeding plumage; in adult female, moult is less extensive. Postnuptial moult

BUNTINGS

209

interrupted by autumn migration. Young have a 'soft nestling plumage' followed by a moult shortly after leaving nest into a juvenal plumage, and then by a moult in the wintering area into adult plumage (Stresemann, E. & V., 1969, 'Die Mauser einiger *Emberiza*-Arten', *J. Orn.* 110: 291-313; also Ticehurst, C. B., *Ibis* 1940: 523-5).

First-winter male. Upperparts and sides of neck fulvous brown obscetely streaked with dark brown, and tinged with olive-yellow on the rump. Underparts dull white, tinged with buff on the breast and with pale yellow on belly, the breast finely striated with dark brown; under tail-coverts pale yellow. Wings and tail as juvenile, the edges and tips of tertials and coverts now faded to creamy white and later fading to white; those median coverts which have been renewed have fulvous white tips.

First-winter female, like ♂, but no yellow on belly, and sides of breast tinged brown.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	92-100	15-17	20-23	68-78 mm
♀♀	85-92	16-17	21-22	65-71 mm (SA)

Weight 3 ♂♂ 29-32 g (Dementiev). 7 ♂♂ (Oct.) 30-35 (av. 30.1); 6 ♀♀ (Oct.) 27-31 (av. 29) g—SA.

COLOURS OF BARE PARTS. Iris dark brown. Bill: upper mandible horny brown; lower mandible yellowish horny. Legs and feet fleshy brown.

2044. Redheaded Bunting. *Emberiza bruniceps* Brandt

Emberiza bruniceps Brandt, 1841, Bull. Sci. Acad. Imp. St. Petersb. 9, col. 12 (Turkmenia)

Emberiza icterica Eversmann, 1842, Add. Pallas Zoogr. Rosso-Asiat. 2: 10 (Transcaspia)

Baker, FBI No. 1134, Vol. 3: 215

Plate 104, fig. 16

LOCAL NAMES. *Gāndām* (Hindi); *Dalchidi* (Sind); *Pacha jinuwaaji* (Telugu).

SIZE. Sparrow +; length c. 17 cm (6½ in.).

FIELD CHARACTERS. Male. Above, crown rufous washed with yellow (golden brown). Upper back yellow; centre of back yellowish olive with blackish streaks; rump bright yellow. A whitish double wing-bar. Below, throat and sides of head cinnamon; sides of neck and rest of underparts yellow.

Female. Above, brown streaked with darker brown. Below, buffish washed with yellow; under tail-coverts yellow.

Confusingly like ♀ Blackheaded. For distinguishing in the hand see 2043 (Museum Diagnosis).

STATUS, DISTRIBUTION AND HABITAT. Mostly a winter visitor, common and widespread. Breeds in northern Baluchistan (Kalat, Quetta, Ziarat) between c. 1600 and 2400 m where summer visitor only. Winters in most of the Indian Peninsula plains from Haryana (Ambala), Rajasthan and Gujarat

14

BUNTINGS

211

MUSEUM DIAGNOSIS. See Field Characters. Moults as in *E. melanocephala* (2043) q.v., with which it is often considered conspecific. The breeding ranges of the two are complementary and hybrids are found at points of contact. Winter ranges practically the same for both.

Young (juvenile). Upperparts with dark brown centres and ochraceous buff edges; underparts fulvous white with a variable amount of spotting on throat, breast, and flanks; under tail-coverts yellowish white; wing-coverts and tertials brown with fulvous white edges and tips, broad on both webs of the tertials; flight-feathers brown, with pale outer edges; tail brown, the outer edges and outer pair of rectrices lighter.

Postjuvénal moult of body, odd lesser- and odd median-coverts in July.

First-winter. Upperparts with heavy streaks of dark brown and with fulvous-brown or fulvous-grey edges, the streaks fine on rump and upper tail-coverts; underparts white tinged with buff, and with dark brown streaks on breast and flanks and occasionally on breast, streaking very variable and absent in some; under tail-coverts pale yellow; belly and rump tinged yellow in ♂, not in ♀; wings as juvenile, but the fulvous white edges faded to creamy white or white; new median-coverts tipped rufous-white. Birds arrive in winter quarters in this dress in August and undergo a complete moult in October and November.

First-spring male. Like adult, but less yellow on mantle; chestnut on crown less extensive, fringes long and often streaked with black. The breeding dress is acquired by abrasion of the brownish edges.

First-spring female. Like adult; possibly those with little or no yellow on rump and less yellow on underparts are characteristic of first-year birds, but this uncertain for lack of moulting material.

After breeding there is an irregular moult of some of the feathers of the crown and body, and sometimes of part of the tail. Birds arrive in winter quarters in this mixture of worn breeding dress with a few just-moulted feathers, and perform a complete moult in October and November to spring dress (Ticehurst, C. B., *Ibis* 1940: 523-5).

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	85-90	16-17	19-22	69-70 mm
♀♀	82-85	15-16		65-67 mm (SA, HW)

Weight 11 ♂♂ (April-Oct.) 22-27; 4 ♀♀ (July) 22-25 g (Faludan). 3 ♀♀ (Oct.) 20-22 g (SA).

COLOURS OF BARE PARTS. Iris brown. Bill dark brown above, plumbeous horn below. Legs and feet pale brown.

2045. Chestnut Bunting. *Emberiza rutila* Pallas

EMBERIZIDAE

Emberiza bruniceps and *E. melanocephala*

Distributional ranges.

■ Breeding

▨ Winter (largely overlapping).

1 *E. bruniceps* (2044), 2 *E. melanocephala* (2043).

east and south to northeastern Bangladesh (Rashid), eastern Madhya Pradesh, eastern Maharashtra (Chanda), western Andhra Pradesh (Cuddapah), southern Karnataka and western Tamil Nadu (Coimbatore). Migrates through Sind, Punjab, N.W.F.P., Gilgit and the Himalayan foothills in Kashmir, Kangra, Lahul and Spiti. Has been recorded on passage once at c. 3000 m and once at c. 4600 m. Has strayed to southeastern Tibet in September (*Ibis* 1944: 361). Affects cultivation, especially grain fields.

Extralimital. Ranges from Afghanistan north to the Altai, the northern Caspian region and northern Iran (where it hybridizes with *E. melanocephala*).

MIGRATION. Autumn passage mostly in the second half of August and first half of September (earliest 22 July). Spring passage, March to early May (latest 9 June in Gilgit).

GENERAL HABITS. Very similar to those of *E. melanocephala* with which it often consorts in enormous numbers in winter to ravage cereal crops.

FOOD. As in 2043.

VOICE AND CALLS. As in 2043. In breeding season male usually sings in vicinity of nest.

BREEDING. Season, May and June. Nest, a cup of weed-stalks and fibres lined with hair, well concealed in garden hedges, rose bushes, vines and peach trees, usually within a metre or so from the ground. Eggs, normally 5, very pale green, finely speckled all over with pale sepia and yellowish brown, more at the larger end. There is no crawling as on most other buntings' eggs. Measurements: 21.5 × 15.5 to 22.5 × 15.5 and 22.5 × 16 mm (Ticehurst).

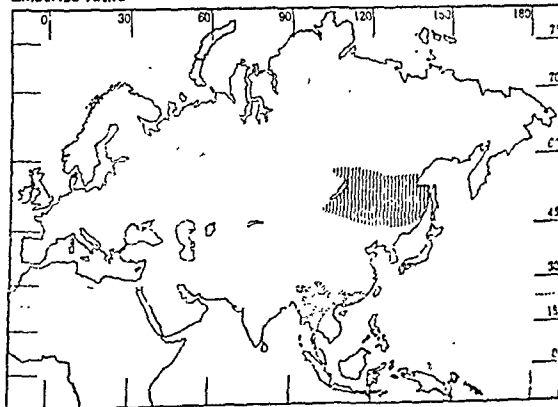

212

EMBERIZIDAE

Female. Above, crown ashy brown with dark streaks. A wide brown band on sides of crown, buffish post-ocular streak and dark ear-coverts. Back ashy brown with blackish streaks; rump chestnut. Below, throat buffish with dark malar stripes. Breast yellowish olive finely streaked; rest of underparts yellow, flanks streaked with dark brown.

STATUS, DISTRIBUTION AND HABITAT. Scarce winter visitor to Manipur, North Cachar and the Japaiguri duars (one record). Obtained in Sikkim in March-April and in Nepal in April (once — Rand & Fleming, 1957).

Emberiza rutila

Distributional range

■ Breeding

▨ Winter

Has straggled to Chitral, 2100 m, in April (Fulton, JBNHS 16: 55) and to Ladakh (Tsokar Lake, c. 4500 m) on 10 June (Osmaston, JBNHS 31: 999 and *Ibis* 1925: 698). Affects rice stubbles, bushes in cultivation and forest clearings.

Extralimital. Breeds in southeastern Siberia from Lake Baikal to Amur-land and Manchuria. Winters in Burma, southern China and northern Indochinese countries.

GENERAL HABITS. Usually in flocks in winter. Feeds on the ground, flies up into trees or bushes when disturbed.

FOOD. Seeds (of grasses, bamboo, etc.).

VOICE AND CALLS. A thin high *teeep* when disturbed (Smythirt).

BREEDING. Extralimital.

MUSEUM DIAGNOSIS. See Field Characters.

Young. Crown, mantle and scapulars streaked black and edged yellowish tawny; a tinge of chestnut on crown. Rump and upper tail-coverts chestnut with fine black streaks. Indistinct supercilium dull buffish white. Ear-coverts brown, centre paler. Lesser-coverts brown tinged chestnut. Greater- and median-coverts

BUNTINGS

213

dark brown with ochraceous tips and edges. Chin and throat dull white more or less streaked with blackish, forming a moustache. Postjuvenile moult of body-feathers, lesser-, median- and greater-coverts.

- First-year male like adult female but chin and throat whitish tinged chestnut. Breast chestnut fringed whitish. A brown moustachial streak. Crown chestnut streaked with black, tips whitish. Chestnut of adult assumed by spring moult of head and throat.

First-year female has no chestnut on crown and breast; throat and upper breast sordid white finely streaked with dark brown. Sides of head mottled fulvous, brown and white.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂ ♀	74-77	c. 14	19-20 (Baker; bill by MD)	56-59 mm

COLOURS OF BARE PARTS. Iris hazel to dark brown. Bill: upper mandible dark horny, lower mandible and gape yellowish horny. Legs and feet pale yellowish brown.

2046. Yellowbreasted Bunting. *Emberiza aureola aureola* Pallas

Emberiza Aureola Pallas, 1773, Reise Russ. Reichs 2: 711

(Irtysh River, Siberia)

Baker, FBI No. 1131, Vol. 3: 210

Plate 104, fig. 11

LOCAL NAMES. None recorded.

SIZE. Sparrow; length c. 15 cm (6 in.).

FIELD CHARACTERS. Male (summer). Above, forehead and sides of head blackish brown. Crown, nape, sides of neck, back and rump deep chestnut. A large white shoulder-patch and a narrow white wing-bar. Tail dark brown with outer rectrices largely white. Below, chin and upper throat blackish brown; throat yellow, this colour extending to sides of neck; a chestnut collar on upper breast; rest of underparts yellow, flanks streaked with blackish brown.

Male in winter lacks the black mask but has dark ear-coverts and a conspicuous yellowish supercilium. Rest of plumage similar but dulled by pale brown fringes.

Female. Above, brown streaked with dark brown; some chestnut on rump. A buff supercilium and dark ear-coverts. Wing-pattern as in male but white replaced by buff. Tail as in male. Below, yellow, brighter on belly and sullied with brown on breast. Flanks streaked with dark brown.

STATUS, DISTRIBUTION AND HABITAT. Winter visitor, common and abundant in the easternmost parts, scarce elsewhere: Manipur, Meghalaya, Bangladesh (all parts — Rashid), the plains of the Brahmaputra, Arunachal Pradesh, Bhutan (?), northern Bengal, Sikkim and Nepal, rarely west to Ambala (JBNHS 31: 1003 and 39: 86). One record from the Baluchistan

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂ ♂	77-83	13-14	20-21	57-68 mm
♀ ♀	72-76			54-60 mm (HW)

Weight 1 ♂ (spring) 21.7 g (GD).

COLOURS OF BARE PARTS. Iris brown. Bill blackish brown above and at tip, brownish flesh below. Legs and feet brown.

2047. Blackfaced Bunting. *Emberiza spodocephala sordida* Blyth

E. (emberiza) sordida 'Hodgson' = Blyth, 1845 (1844), Jour. Asiat. Soc. Bengal 13: 958 (Nepal)

E. (emberiza) melanops Blyth, 1845, Jour. Asiat. Soc. Bengal 14: 554 (Tipperah)

Baker, FBI No. 1132, Vol. 3: 212

Plate 104, fig. 14

LOCAL NAMES. None recorded.

SIZE. Sparrow; length c. 15 cm (6 in.).

FIELD CHARACTERS. Male. Above, base of bill, lores and round eye black. Head and nape olive-grey. Back brown with blackish streaks. A whitish and a buff wing-bar. Outer rectrices white conspicuous in flight. Below, chin black. Throat and breast olive-grey. Belly very pale yellow.

'Most conspicuous field character: black patch on lores showing up against dark greenish head and neck' (Stanford).

Female. Above, crown rufous-brown streaked with dark brown like back. A pale supercilium and dark ear-coverts. Tail as in male. Below, pale yellow with dark moustachial streak, breast and flanks streaked with dark brown.

STATUS, DISTRIBUTION AND HABITAT. Common winter visitor to Manipur, Nagaland, Meghalaya, Bangladesh (all parts) and the plains of the Brahmaputra; less common in the Jalpaiguri and Sikkim duars to eastern Nepal. Kathmandu Valley (Fleming, JBNHS 68: 834). Affects high grass, bamboo and scrub jungle, hedgerows in village compounds, margins of ricefields and marshes; in the hills up to c. 1000 m.

Extralimital. Western China from northern Yunnan and northern Hupeh to Kansu and Tsinghai. Other subspecies in Japan, Sakhalin and west in Siberia to Yakutia and the Altai. The species winters in southern China, NE. Burma, and the Indochinese countries.

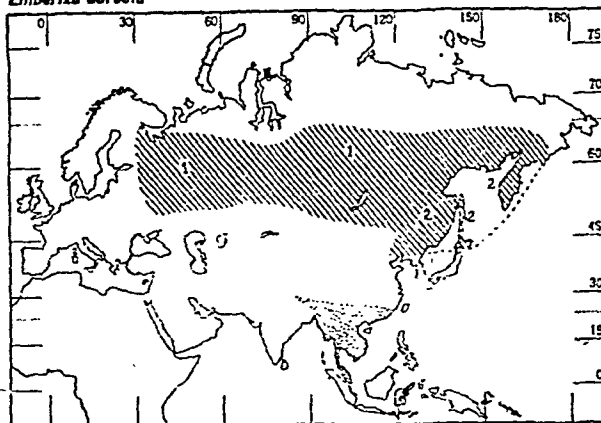

MIGRATION. Occurs in winter quarters from October (earliest 24 Oct.) to April (latest 7 Apr.). Recorded on passage at c. 2700 m in Sikkim on 19 December.

GENERAL HABITS. Keeps in pairs or small flocks of four to six birds; usually in cover and near water. Feeds on the ground in damp paddy stubbles or on moist edges of jheels and tanks. Also on ripening paddy in the ear. Flight of flock disorderly and undulating, reminiscent of a flock of munias.

FOOD. Rice and other seeds.

1 *aureola* (2046), 2 *ornata* (RE).

coast (JBNHS 31: 868) and one from the Nicobars, out of a flock of about 20 (SF 1: 258). Affects cultivation and grassland, hedgerows, gardens and sometimes threshing floors and market-places in and around hamlets; in the hills up to c. 1500 m.

Extralimital. Breeds from Finland to eastern Siberia. A subspecies in Kamchatka, Sakhalin, Hokkaido and Amurland south to Korea. Winters in Burma, southern China and the Indochinese countries.

MIGRATION. Occurs in winter quarters from October (earliest 7 Oct.) to the end of April. Passage recorded in southeastern Tibet, 2800 m in May, and in Nepal Valley.

GENERAL HABITS. In winter usually keeps in flocks, sometimes numbering up to 200 individuals, commonly in association with Spotted and other munias. Feeds on the ground, flies up into trees when disturbed. Roosts communally in bushes.

FOOD. Seeds (grass, bamboo, rice, etc.); occasionally insects. Recorded hawking flying insects from bushes (Stanford, JBNHS 37: 872).

VOICE AND CALLS. Call-notes, a short *zip* and a soft trilling note *tsrit* (Smythies). A sweet chirping song may be heard in winter quarters in March and April before departure; uttered from bare tops of small trees.

BREEDING. Extralimital.

MUSEUM DIAGNOSIS. See Field Characters. Postnuptial moult completed before arrival. Spring moult of face and part of throat in winter quarters.

Young. Above, nearly like female. Below, pale yellowish heavily streaked with brown on breast and flanks.

LOCAL NAMES. None recorded.

SIZE. Sparrow; length c. 15 cm (6 in.).

BUNTINGS

217

FIELD CHARACTERS. Male. *Above*, crown grey; a broad black eye-stripe from lores to nape; cheeks whitish. Back and rump chestnut; tail brown, outer rectrices white. *Below*, breast white; lower breast chestnut. Rest of underparts fulvous white, flanks streaked with chestnut. Colour pattern obscured by pale fulvous edges after postnuptial moult.

Crown becomes nearly white (by abrasion) before spring emigration.

Female. *Above*, head greyish brown; lores and round the eye fulvous; ear-coverts and sides of neck brown. Back streaked with dark brown; rump rufous-chestnut. Outer rectrices white. *Below*, throat fulvous-buff with dark moustachial streak. Breast rufous; rest of underparts fulvous with dark streaks.

STATUS, DISTRIBUTION and HABITAT. Common summer (breeding) visitor and short-range migrant. Breeds in Pakistan from northern Baluchistan north to Chitral, Gilgit, Astor and Baltistan, and along the Himalayan foothills through Murree and Kashmir to Garhwal. Breeds between c. 2200 and

Emberiza stewarti

Distributional ranges.

Breeding

Winter

2700 m in the Quetta and Chagai districts, between 1500 and 2300 m, locally 2700 m in Gilgit, Baltistan and Kashmir, up to 3000 m in the Kurram Valley, to 3300 m in Gilgit, 3600 m in Chitral (Fulton), and between 1200 and 1800 m in Chamba, Kangra and Kulu (Whistler); scanty data from farther east but apparently between c. 1500 and 2400 m in Garhwal (*Nidification* 3: 93). Affects grassy and rocky hillsides with or without bushes. Usually avoids cultivation, but in Gilgit freely nests in gardens. Prefers bare rocky slopes whereas *E. fucata* frequents bush and scrub. Ranges of *E. stewarti* and *E. cia* do not appear to overlap, the former replacing *cia* at lower levels on more open arid ground; both species may occasionally be

Plate 104, fig. 7

LOCAL NAMES. None recorded.

SIZE. Sparrow; length c. 15 cm (6 in.).

FIELD CHARACTERS. Male. *Above*, head olive indistinctly streaked, with a conspicuous pale yellow eye-ring. Back brown with blackish streaks. Outer rectrices white. *Below*, throat pale yellow with distinct dark moustachial streaks, and dark fleckings on sides and lower part. Rest of underparts buffish rufous.

Female. *Above*, brown with dark streaks; a noticeable eye-ring. *Below*, cream-buff with dark moustachial streaks and heavy streaks on breast and flanks. Outer rectrices white.

Yellow throat distinguishes the male from *E. buchanani*.

STATUS, DISTRIBUTION and HABITAT. Vagrant; on spring migration obtained twice in Gilgit (*Ibis* 1881: 80 and 574) and once in Kashmir (JBNHS 18: 463). Sight recorded at Delhi, 18–19 April 1970 (P. Jackson & A. J. Gaston, JBNHS 69 (3): 654–5). Affects orchards or grassy slopes with bushes.

Extralimital. Breeds in the western Palearctic from the Altai and Iran west to Scandinavia and Spain. Winters from the Mediterranean to Senegal and Somalia, Arabia and Iran.

GENERAL HABITS. As in 2050.

FOOD. Seeds and insects.

VOICE and CALLS. Call-note on migration and in winter quarters, a sharp tick. When disturbed, a soft *pt-pt* or *ti-ti-ti* (Jackson). Different notes are uttered on breeding grounds (MD).

MUSEUM DIAGNOSIS. See Field Characters. For details of plumage see Baker, loc. cit.

218

EMBERIZIDAE

seen side by side. In northern Baluchistan also found in juniper forest. Winters in the foothills from N.W.F.P. and the Salt Range east to west-central Nepal (Rand & Fleming, *Feldiana* 41: 210), and in the plains of Punjab, Haryana, western Uttar Pradesh (to Etawah), Rajasthan [Jodhpur, Ajmer, and Bharatpur (once)], Madhya Pradesh (common in the northern part), northeastern Maharashtra (Nagpur—D'Abreu) and Gujarat [once to Jasdan (JBNHS 59: 956)]. There are no winter data from either Baluchistan or Sind, except for odd records from Quetta and the Khirthar Range in December. Affects grassy scrub-jungle and olive-groves etc. In the Himalayan foothills occurs commonly between c. 200 and 1400 m, in smaller numbers up to 1800 m, seldom 2500 m (Simla).

Extralimital. Afghanistan, eastern Iran and north to southeastern Kazakhstan.

MIGRATION. Occurs on summer grounds from April to September, post-breeding dispersal beginning in August. Autumn passage mostly in September, spring passage March to mid April. Abundant passage noted in Chagai (Baluchistan), Kashmir, Simla and Dehra Dun.

GENERAL HABITS. Gregarious in winter when usually found in small flocks, sometimes in company with other buntings. Feeds on the ground; tends to sit about stolidly on bushes or leafless branches of trees when not feeding, often with 'crest' partially raised.

FOOD. Mainly seeds of grass etc.

VOICE and CALLS. Call-note, a sharp *tit* reminiscent of that of *Cettia brunifrons* (HW). Song rendered as a monotonous *zwig-zwig-zwig* (Bates & Lowther); resembles that of the Yellow Bunting (*E. citrinella*) minus the last long-drawn note (BBO). Sings from exposed branches or top of boulders.

BREEDING. Season, mid April to July. *Nest*, a cup of grass bents and fibres lined with hair or wool, placed on the ground under a bush, tuft of grass, or boulder on steep slopes, sometimes in crevices in rocks. *Eggs*, 3 to 5, usually 4, dull white mottled and blotched with dark brown and pale purplish grey with sometimes a few streaks. Average size of 98 eggs 19.5 × 14.6 mm (Osmaston), of 100 eggs 19.7 × 14.7 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters. Freshly moulted plumage (in autumn) dulled by pale fulvous edges. There is no spring moult; breeding plumage results from abrasion of fulvous edges. Pattern of plumage somewhat inconstant. In the male a black throat-patch may be present or absent and amount of chestnut on wing-coverts variable.

Young, similar to adult ♀ except that absence of fulvous fringes to feathers makes streaking appear more sharply defined; no trace of chestnut on breast.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	78–82	12–14	18–19	64–70 mm
♀♀	72–81			

(MD, Rand & Fleming)

Weight 13 ♂♂ (April–June) 12.9–17; 5 ♀♀ (April–June) 13–16.7 g (Paludan).

COLOURS OF BARE PARTS. Iris dark brown. Bill: upper mandible dark brown, lower plumbeous; mouth fleshy. Legs and feet brownish flesh.

220

EMBERIZIDAE

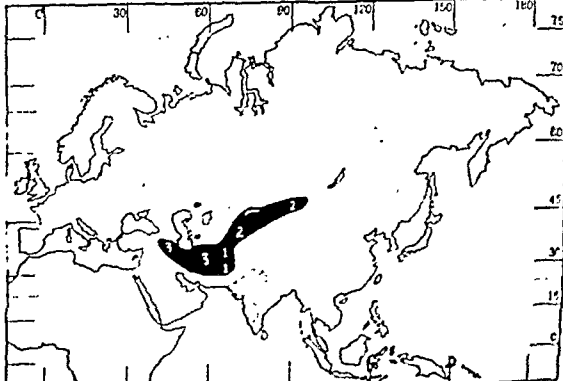

FIELD CHARACTERS. Male. *Above*, head grey with a conspicuous whitish eye-ring. Rest of upperparts brown slightly tinged with rufous and with darker streaks on back. Tail brown, distinctly forked; outer rectrices white. *Below*, throat more or less mottled rufous and whitish; an indistinct dark moustachial streak. Breast rufous-chestnut, in fresh (autumn) plumage dulled by pale fringes.

Female similar to male but a little duller; moustachial streak somewhat more noticeable.

Whitish eye-ring a very conspicuous feature in both sexes.

STATUS, DISTRIBUTION and HABITAT. Mostly winter visitor to western and central India, from northern Gujarat (including the Kathiawar Peninsula and Kutch) east and south to central Uttar Pradesh (Lucknow), eastern Maharashtra (Nagpur), northern Andhra Pradesh (Asifabad, c. 80°E.) and

Emberiza buchanani

Distributional ranges

Breeding

1 *buchanani* (2050), 2 *neobursa* (RE), 3 *ceratini* (RE).

central Karnataka (Marikānivē, c. 14°N., JBNHS 43: 583); also sparsely in Sind, perhaps not regularly. Affects stony, sparsely scrubbed country; euphorbia-covered broken hillsides, etc. — typical *Pedicularis argemone* facies; sometimes stubble fields.

A scarce summer (breeding) visitor to northern Baluchistan (Quetta) between c. 1650 and 2400 m (Mfinertzhagen, *Ibis* 1920: 142). Recorded on 8 August in the upper Yasin Valley, Gilgit, c. 3100 m (Riddulph, *Ibis* 1922: 271; early migrant?). Also breeds in Afghan Safed Koh and Tera Kotla Valley. In summer affects dry stony foothills with sparse bushes.

Extralimital. Adjacent parts of Afghanistan (Chaman, Garder, Safed

Koh) and northern Afghanistan. The species ranges north to the Altai and west to Armenia.¹

MIGRATION. Breeders arrive in Baluchistan in March, depart in September. Abundant passage through Kutch in September and March. Recorded in winter quarters from October (earliest 8 October) to April (latest 18 April in Andhra, 29 April in Gujarat). Spring passage mostly in April, autumn passage mostly in September. Migrates through Sind, Baluchistan (from the Makran Coast to Chagai), N.W.F.P., Gilgit, Kashmir (rare), Punjab, Haryana and the foothills east to Dhunda, N. of Mussooree c. 78°30'E. (in the last locality as late as 25 May).

GENERAL HABITS. Gregarious in winter when usually met with in small scattered flocks of 8 to 20 birds, sometimes in larger flocks in company with other buntings. During spring migration apparently keeps isolated or in pairs. Feeds on the ground. Flight, gait on ground, and general behaviour very pipit-like.

FOOD. Chiefly seeds.

VOICE and CALLS. Call-note, in winter, a subdued click. Song apparently identical with that of Ortolan Bunting (cf. Erard & Etchécopar, 1970), a pleasant melancholy ditty of about five notes, first four on same tone, last lower.

BREEDING. Season, May and June. Nest, a cup of coarse grass and fibres lined with finer grass stems, placed on the ground under a stone or a tuft of grass. Eggs, 4, white, blotched, spotted and hair-streaked with deep reddish brown. They measure from 19 × 14.9 to 20.3 × 15.9 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters. For details of plumage see Baker, loc. cit.

MEASUREMENTS

(Kumaon)

Baker, FBI No. 1125, Vol. 3: 205

Plate 104, fig. 6

LOCAL NAME. Wan tsar (Kashmir).

SIZE. Sparrow; length c. 15 cm (6 in.).

FIELD CHARACTERS. Male. Above, head bluish grey; black coronal stripes, black eye-stripe, black moustachial streak looping up to join eye-stripe behind cheeks. Cheeks and supercilium whitish. Back chestnut-brown streaked with black. Rump rufous-chestnut. Outer rectrices white, often flashed open. Below, throat and breast bluish ashy; rest of underparts rufous-chestnut.

Female like male but duller.

Distinguished from rather similar *E. fucata* (2055) and *E. stewarti* (2048) by bluish grey breast.

STATUS, DISTRIBUTION and HABITAT. Common resident, subject to vertical movements. Western Himalayas south of the main range from Hazara and Murree through Kashmir (the commonest bunting) and east to central Nepal (Lowndes, JBNHS 53: 34). See 2051 for localities where intergrades occur. Breeds between c. 2000 and 3600 m (Kashmir to Simla), in smaller numbers down to c. 1500 m (Kulu), between 2400 and 4000 m (Garhwal) and between 3000 and 3900 m (Nepal). Winters (beginning of November to March) mostly below c. 2100 m (once 3600 m), down to c. 600 m, in western Nepal obtained at c. 2500-2700 m (intermediate in varying degree between this race and *par*). Affects grassy and bush-clad slopes in boulder-strewn or rocky country, juniper forest, open pine forest and, locally, margins of cultivation.

▨ Breeding. Broken line in west = winter extension of 1.

1 *par* (2051), 2 *stracheyi* (2052), 3 *khamensis* (2053), 4 *yunnanensis* (2054).

Ladakh, Suru Valley, Lahul and Spiti. Specimens from the following localities are intermediate between *par* and *stracheyi*: Kagan Valley, Chitral, Hunza, Gilgit, Astor, Baltistan, Baltal, Lolab, Suru, Dras and Sind valleys, Lahul and Spiti.

Breeds from c. 2700 m up to 3300 m (Safed Koh) and up to 4200 m from Chitral to Lahul. Winters below c. 2800 m in Baltistan, Gilgit and Chitral, in N.W.F.P. south to Quetta (rare), in the Punjab foothills (below c. 600 m) and in the plains south to Bahawalpur, Haryana to Ambala and Delhi, Dehra Dun, western Nepal (varying between *par* and *stracheyi* fide Rand & Fleming, 1957: 210). A specimen from Varanasi (Benares), Brit. Mus. Affects dry rocky hillsides with grass and bushes. In the plains frequents semi-desert, neighbourhood of canal cultivation, cotton fields and pampas grass.

Extralimital. Adjacent parts of southern Tibet.

GENERAL HABITS. Keeps singly, in pairs or small flocks. Feeds on the ground, perches on bushes or trees. Tail constantly flicked open, flashing white outer rectrices.

FOOD. Seeds, grain and insects.

VOICE and CALLS. Contact-note when feeding in flock, a thin subdued mouse-like squeak *tsi* or *swip* oft repeated. An agitated plaintive *swee, swee* when an intruder near nest. A twittering song, reminiscent of the Goldfinch's but shorter.

BREEDING. Season, May to August according to altitude. Nest, a deepish cup of dry grass lined with hair, placed on the ground on steep slopes, at the base of a bush or under a tuft of grass, occasionally in a low bush, well concealed. An unusual site recorded was in a bough of a fir tree 2.7 m above ground. Eggs, usually 3, sometimes 4, greyish white marked with dark purplish scrawls, spots and blotches. Average size of 102 eggs 21.5 × 15.7 mm (Osmaston). Building of nest and care of young by both sexes, incubation apparently by female only. Frequently brood-parasitized by *Cuculus canorus*.

MUSEUM DIAGNOSIS. See Field Characters; for distinction from *par* see 2051, under Museum Diagnosis.

Young. Above, rufous brown densely streaked with black. Below, fulvous streaked with dark brown on throat, breast and flanks.

MEASUREMENTS

FIELD CHARACTERS. As in 2052, q.v.

STATUS, DISTRIBUTION and HABITAT. Winter visitor to southeastern Tibet. May occur in the higher hills of Arunachal Pradesh.

Extralimital. Breeds in northern Yunnan and north to northeastern Szechuan and western Hupeh.

GENERAL HABITS, FOOD and VOICE. As in 2052.

MUSEUM DIAGNOSIS. Similar to *khamensis* (2053) but darker, more richly coloured.

MEASUREMENTS and COLOURS OF BARE PARTS. As in 2053.

EMBERIZA FUCATA Pallas

Key to the Subspecies

Head grey, upperparts chestnut.....*E. f. fucata*
Head purer grey, upperparts richer chestnut *E. f. arcuata*

2055. Indian Greyheaded Bunting. *Emberiza fucata arcuata* Sharpe

E. (mberiza) arcuata Sharpe, 1888, Cat. Bds. Brit. Mus. 12: 494
(Himalayas, restricted to Simla by Baker, 1926, FBI 3: 199)
Baker, FBI No. 1121, Vol. 3: 199
Plate 104, fig. 10

LOCAL NAME. *Pāthār-chiria* (? Hindi).

SIZE. Sparrow; length c. 15 cm (6 in.).

FIELD CHARACTERS. Male. Above, crown and nape grey streaked with black; ear-coverts chestnut. Back rufous-brown densely streaked with black; rump rufous. Wings brown, tertials black edged with rufous-chestnut; shoulder rufous. Outer rectrices white. Below, throat and upper breast white with black moustachial stripes and dense streaking on breast forming a black gorget; lower breast chestnut. Flanks rufous-chestnut streaked with dark brown; belly whitish buff.

Female, similar to male but paler and duller: crown pale brown rather than grey; a short, whitish supercilium.

15

BUNTINGS

227

VOICE and CALLS. A bright, short, typically bunting song; may be rendered as *chick-chick-he'll get used to you-chick* (Osmaston) uttered from a bush or from top of high weeds.

BREEDING. Season, May to July. Nest, a cup of dry grass lined with hair, placed on the ground under a bush or tuft of grass on a steep slope. Eggs, 3 or 4, pale greenish grey speckled with dull reddish and purplish brown, without scrawls. Average size of 10 eggs 19.9 × 15.6 mm (Osmaston).

MUSEUM DIAGNOSIS. See Field Characters. Differs from nominate *fucata* (2055a) in having the head purer grey and the upperparts richer chestnut, less fulvous; black markings on sides of throat and breast usually heavier and more numerous; flanks richer rufous.

In this and *E. pusilla* (2056) the tail-feathers are narrower and more pointed at tips than in most other buntings.

MEASUREMENTS

Wing 69-71; tail 65-67 mm (Baker). Rest as in 2055a.

Weight 6 ♂♂ (April-June) 18-21; 7 ♀♀ (April-June) 16-19 g — SA.

COLOURS OF BARE PARTS. Iris dark brown. Bill: upper mandible dark horny brown; lower mandible pale horny brown. Legs and feet pale fleshy brown.

2055a. Amur Greyheaded Bunting. *Emberiza fucata fucata* Pallas

Emberiza fucata Pallas, 1776, Reise Russ. Reichs 3: 698
(Onon and Ingoda Rivers)
Baker, FBI No. 1120, Vol. 3: 198

LOCAL NAMES. None recorded.

SIZE. Sparrow; length c. 15 cm (6 in.).

FIELD CHARACTERS. As in 2055, q.v.

STATUS, DISTRIBUTION and HABITAT. Winter visitor, locally common. Manipur, Nagaland, Meghalaya, Assam, most of Bangladesh, Arunachal Pradesh and Bhutan foothills, Jalpaiguri duars, west to eastern Nepal (Hodgson; also Fleming & Traylor, 1968, *Fieldiana* 53: 190). Affects wet stubbles, marshes, grassland and bushes, usually in the lowlands.

Extralimital. Breeds in Amurland, Manchuria and Japan; winters in Southern China and northern Indochinese countries.

MIGRATION. Arrives in winter quarters in early November, departs in April (latest 14 May in Burma).

GENERAL HABITS, FOOD and VOICE. As in 2055.

BREEDING. Extralimital.

MUSEUM DIAGNOSIS. See 2055.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♀	71-76	15-16	22-23 (Baker; bill by MD)	62-65 mm

COLOURS OF BARE PARTS. Iris brown. Bill fleshy brown, darker on culmen, paler below. Legs and feet fleshy yellow to fleshy pink.

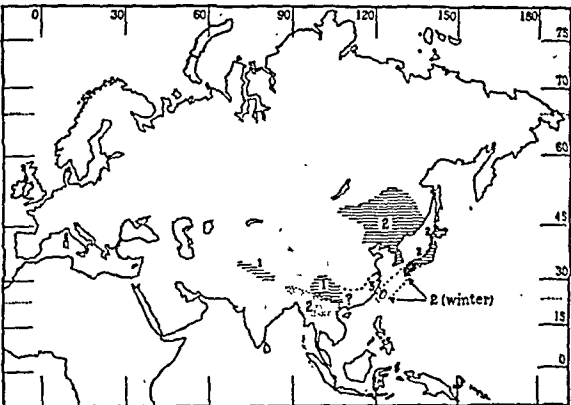

226

EMBERIZIDAE

Greyish hindneck, chestnut ear-coverts, chestnut scapulars and white outer rectrices very noticeable in flight.

STATUS, DISTRIBUTION and HABITAT. Uncommon resident, subject to vertical movements. Western Himalayas from Chitral (Reshan, Mastuj Valley, fairly common — Perreau, JBNHS 19: 913), Hazara and Murree east to Garhwal, Kumaon and western Nepal (Makala, in June) [specimens from last three regions in Brit. Mus.]. Also undated specimens from Darjeeling (Hume), Dafia Hills (Godwin-Austen) and Khasi Hills (Gould), 'seem

■ Breeding

▨ Winter

1 *arcuata* (2055), 2 *fucata* (2055a), 3 *khamensis* (RE).

intermediate but perhaps nearer to *arcuata* (HW). See extralimital distribution, below. Breeds between c. 1800 and 2300 m in Kashmir, 1650 and 2700 m in Kulu. Winters from at least 1500 m down to the foothills and adjacent plains [Saharanpur (SA), Ambala (Jones)]. Affects hillsides with bushes and scrub of *Berberis*, *Coloneaster*, *Indigofera*, wild rose and juniper, especially along rivers. In winter also on swampy ground.

Extralimital. Northern Afghanistan (JASB 55: 85, 1887), Burma (Mt Victoria and north-east Burma, apparently in winter — Smythies, 1953), Yunnan, Szechuan and Kweichow (cf. Cheng, 1953, also Traylor, M. A., 1967). Other subspecies in eastern China (Kwangtung to Kiangsu), northern China, Manchuria, Amurland and Japan, wintering in southern Japan, southern China and northern Indochinese countries.

GENERAL HABITS. Keeps in pairs or small parties according to season, close to the ground amongst low herbage. Feeds on the ground. In winter quarters often roosts in marshy reed-beds.

FOOD. Grass seeds and small insects.

228

EMBERIZIDAE

2056. Little Bunting. *Emberiza pusilla* Pallas

Emberiza pusilla Pallas, 1776, Reise Russ. Reichs 3: 697
(Transbaikalian Alps)
Baker, FBI No. 1122, Vol. 3: 200
Plate 104, fig. 9

LOCAL NAME. *Dao miji* (Cachari).

SIZE. Sparrow —; length c. 14 cm (5½ in.).

FIELD CHARACTERS. Male. Above. A rufous median coronal stripe between two broad black stripes on sides of crown. Supercilium and side of head rufous with a dark spot on ear-coverts. Rest of upperparts rufous-brown streaked with blackish. Outer rectrices white. Below, chin rufous, rest of underparts white streaked with black on breast and flanks.

Female, similar but duller.

Casually confusable with Tree Pipit, but rufous patch on sides of head and noticeably forked tail, though also with white outer feathers, diagnostic.

STATUS, DISTRIBUTION and HABITAT. Common winter visitor. Manipur, Nagaland, Meghalaya, Sylhet and the Chittagong Hill Tracts of Bangladesh, the plains of the Brahmaputra, Arunachal foothills, Bhutan foothills, Sikkim and Jalpaiguri duars and Darjeeling district; westward in the foothills to central Nepal, rarely to Chamba and Kotgarh. One record from South Andaman Island. Winters mostly below 1800 m. Affects reeds, grass, rice stubbles, and scrub about cultivation in open country.

Extralimital. Breeds in tundra and forest-tundra of Eurasia from Finland to the Sea of Okhotsk. Winters mostly in southern China, Burma, and northern Indochinese countries.

MIGRATION. Spring passage in March and April in Nepal and Sikkim. Arrives in winter quarters in October. Recorded on passage in Hunza gorges on 21 October. Most birds however migrate through eastern Asia.

GENERAL HABITS. In winter usually keeps singly or in small flocks, often in company with *E. fucata* and tree pipits. Rather secretive. In common with some other buntings (e.g. *spodocephala*, *aureola*, *fucata*), and accentors (e.g. *Prunella immaculata*) has a habit of keeping closely to cover on the ground. When approached, flushes out suddenly and dives instantly behind the next bush a few paces away, giving a series of short, sharp notes. Identification. If followed, repeats this 'perching

on bare tree-tops on wintry tundra; also on

FOOD. Seeds, insects and their larvae.

VOICE and CALLS. Call-note, a short *tzit*.

BREEDING. Extralimital.

MUSEUM DIAGNOSIS. See Field Characters.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail

(Isin, Iran)

Baker, FBI No. 1136, Vol. 3: 217

Plate 104, fig. 8

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 14 cm (5½ in.).

FIELD CHARACTERS. Male. Above, crown greyish white streaked with blackish. A white supercilium and blackish stripe behind eye. Rest of upperparts brown with darker streaks. Wings bright rufous. Below, throat and breast greyish white streaked with black, a white malar stripe on side of throat and a dark moustachial streak. Belly fulvous-buff.

Female, similar to male but head and throat brown with darker streaks. In flight, at a distance, rufous wings and general effect reminiscent of female Crested Bunting (2060).

STATUS, DISTRIBUTION and HABITAT. Common but locally distributed resident, subject to local movements. Pakistan from Baluchistan, Sind, and Punjab Salt Range, east and south in northwestern India to southern Uttar Pradesh (Etawah), central Madhya Pradesh (Sagar) and central Maha-

Emberiza striolata

■ Distributional ranges. 1 *striolata* (2057), 2 *extralimital* subspecies *rashtra* (Daulatabad). Affects rocky or stony, sparsely thorn- or euphorbia-scrubbed hillsides and nullahs, ancient hill forts and ruins, etc. In winter spreads to sandy plains, tamarisk scrub and *sarkhan* grass areas in the vicinity of canals.

BUNTINGS

231

of head and white collar entirely concealed by rufous-brown fringes; a conspicuous buff supercilium, dark ear-coverts, buff malar stripe and sides of neck; black of throat partly concealed by pale fulvous tips.

Female has rufous-brown crown with dark streaks; pale buff throat with black streaks on sides.

STATUS, DISTRIBUTION and HABITAT. Winter visitor, locally common. Pakistan in Gilgit, N.W.F.P., Punjab, Sind and northern Baluchistan (scarce), and northwestern India in Haryana (Rohtak and Ambala), and

Emberiza schoeniclus

Distributional range of the species

▨ Breeding

▤ Winter

1 *pallidior* (2058), 2 *pyrrhuloides* (2059). Extralimital subspecies not numbered. vicinity of Delhi. Affects riverain country — reed-beds, irrigated crops, *khan* grass and *kandi* (*Prosopis*) jungle, bushes in nullah-beds, etc.

Extralimital. Southwestern Siberia from the Urals to the Altai. Winters to the south of breeding range.

MIGRATION. Arrives in winter quarters in November, departs in March. GENERAL HABITS. Keeps singly, in pairs or small parties. Usually perches on reeds. Roosts, often communally, in reed-beds.

FOOD. Seeds (chiefly of marsh plants), and insects.

VOICE and CALLS. A plaintive *tsee-u*.

BREEDING. Extralimital.

MUSEUM DIAGNOSIS. See Field Characters.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail

EMBERIZIDAE

230

Extralimital. Ranges west through southern Iran and Arabia to the Sinai Peninsula, Eritrea and Somalia. Other subspecies in southern Ethiopia, southern Sahara, Morocco and Algeria.

GENERAL HABITS. Keeps in pairs or in flocks according to season. Unobtrusive and easily overlooked. Feeds quietly on the ground, hopping about stiffly like a sparrow (not running like a pipit). In arid country, regularly resorts to drink at water-holes in the forenoon.

FOOD. Seeds (of grasses, compositae, etc.).

VOICE and CALLS. Song, a lively *whi-which-whi-which-whi-which*, the first two syllables short and accent on the final note; also described as a rich *whi-ehi-whi-ehi-ehi* ending in an extra, subdued *chi* (SA); uttered from a stone, bush-top or ruined building.

BREEDING. Season, end of February to November. Nest, a cup of roots and grass lined with feathers, placed on the ground under a rock, in niches in crumbling walls, etc. Eggs, 2 or 3, pale bluish or whitish, spotted and speckled with brown, intermingled with clouds and streaks of the same colour, more numerous at the large end. Average size of 15 eggs 20 × 15 mm (Baker). Both sexes share in building the nest and feeding the young.

MUSEUM DIAGNOSIS. See Field Characters.

Emberiza pyrrhuloides Pallas, 1811, Zoogr. Rosso-Asiat. 2: 49

(Astrakhan, *cide* Vaurie, 1956, Amer. Mus. Novit., No. 1795: 8)

Not in Baker, FBI

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 15 cm (6 in.).

FIELD CHARACTERS. As in 2058 but larger; bill noticeably stouter; back buff rather than dark brown; flanks of male unstreaked.

STATUS, DISTRIBUTION and HABITAT. Rare winter vagrant. One record: two males obtained at Wular Lake, Kashmir on 20 March (Meinertzhagen, *Ibis* 1927: 394). Affects reed-beds.

Extralimital. Ranges from the Caspian Sea to western Mongolia.

GENERAL HABITS. As in 2058.

FOOD. Apparently chiefly insects obtained from reed-stems with its large specially adapted bill, remarkably similar in shape to that of some *Paradaxornis* species which also extract insects from bamboo- and reed-stems.

VOICE and CALLS. Undescribed but said to be somewhat different from that of thin-billed races (Dementiev).

BREEDING. Extralimital.

MUSEUM DIAGNOSIS. Differs from *pallidior* in being much paler above, fulvous buff; white collar broader; flanks of male unstreaked, those of female with only fine rufous streaks. Overall size markedly larger; bill much stouter and highly arched.

MEASUREMENTS

Plate 103, fig. 14

LOCAL NAME. *Pāthār-chirā* (? Hindi).

¹ Cf. Tiechurrt, C. B., 1932, Bull. Brit. Orn. Cl. 53: 15-16 for use of *lathami* v. *erythropterus*.

BUNTINGS

233

SIZE. Sparrow; length c. 15 cm (6 in.).

FIELD CHARACTERS. Male. Entirely black with chestnut wings and tail, and a long, pointed black crest.

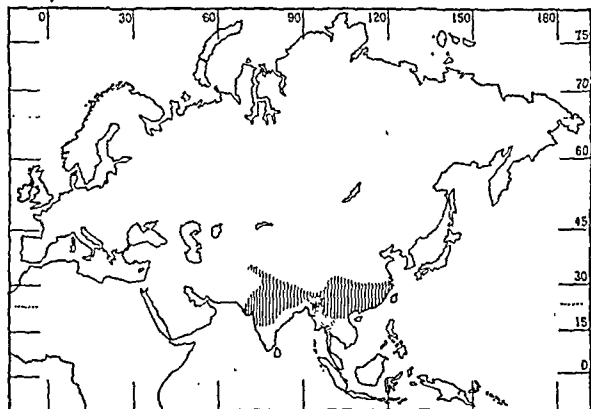

x c. 1

Female. Above, olive-brown with dark brown streaks. Crest shorter; a pale eyering. Edge of wing and outer rectrices rufous. Below, yellowish buff with dark streaks on breast and dark moustachial streak.

STATUS, DISTRIBUTION and HABITAT. Common resident, but rather local and capricious; in the hills subject to vertical

movements. The Himalayan foothills from Hazara to Bhutan and south-eastern Tibet, and south in India through eastern Rajasthan and Mt Abu to Gujarat (Gir Forest. Not recorded elsewhere in Kathiawar or in Kutch), southwestern Maharashtra (Satara), northern Andhra Pradesh (Wardha Valley), eastern Madhya Pradesh (Raipur), and southern Bihar (Lohardaga); also the hills of Bangladesh, Meghalaya, Cachar and Manipur,

Melophus lathami

Residential range

Winter (non-residents)

south to the Chittagong region. In the west Himalayan foothills occurs in summer up to c. 1500 m, in central Nepal to 2200 m (Desfayes), in Sikkim and Bhutan to 1800 m, in Nagaland to 2400 (Tytler); withdraws from the higher levels in winter (leaving in October, returning in April). Seasonal movements also noted in the hills of central India and in northern Bengal (where a winter visitor). Affects dry stony sparsely scrubbed hillsides; in winter also rice stubbles and open stony scrub country in dry-deciduous

EMBERIZIDAE

jungle; particularly fond of charred grass patches where its coloration is highly obliterative.

Extralimital. Ranges east to Kwangtung and Chekiang.

GENERAL HABITS. Much as other buntings. Gregarious in winter when it keeps in small loose flocks; never in such large congregations as many other buntings. Feeds on the ground in stony fields, on ghat roadsides and cross-country cart tracks, etc.; rarely, if ever, from ears of standing cereal crops. Commonly perches on rocks or bushes. Roosts in hedges and thorn thickets in company with tree pipits, etc.

Courtship (one observation, SA). Male singing from euphorbia-top, chased female with fluttering lark-like flight, tail partially cocked and crest erect. On ground he drooped his wings, spread his tail and fluffed out the rump-feathers. He raised and opened sideways the wing on the side of the hen while walking in a semicircle round her about a metre away. Female responded in same way by raising her wing on his side. Thus, they drew closer. Male hopped on to her back and treaded her, his wings fluttering throughout the act. Thereafter each picked up a blade of grass and flew off towards nest.

FOOD. Chiefly grass seeds.

VOICE and CALLS. Call-note, a repeated *tip* or *pink* while feeding. Song, rendered as *tsi-tsi-tsi-tsu-tsu-tsu*, last three notes descending (MD); also as *which* . . . *which* . . . *which-ichi-when-which* (accent on *when*). Reminiscent of the song of *Saxicoloides* but with this peculiarity that it invariably commences with the detached single (sometimes double) subdued *which* (SA). Usually uttered from the top of a bush, a rock or telegraph wire.

BREEDING. Season, April to August. Nest, a cup of grass bents and rootlets lined with fine fibres and hair, placed on the ground under a rock or in a hollow in a bank or loosely built stone wall. Eggs, 3 or 4, white faintly tinged with greenish marked with freckles, spots and tiny blotches varying from pale reddish to deep brown or purplish brown, more densely at the large end. Average size of 60 eggs 20.1 x 15.6 mm (Baker). Building (?) and incubation by female. Sometimes brood-parasitized by *Cuculus canorus*.

MUSEUM DIAGNOSIS. See Field Characters.

Young like female. Feathers of upperparts with distinct pale fringes; lower throat and breast more coarsely streaked.

First-year male. Upperparts a little darker than adult female; crest intermediate in length. Sides of head and underparts black mixed with fulvous-brown, belly and under tail-coverts mostly of the latter colour. Primary-coverts dark brown marked slightly or not with chestnut; rest of coverts as in female but more marked with chestnut. Rest of wing as in adult male but outer webs of primaries often marked with black.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	79-86	13-16	19-21	{ 61-69 mm
♀♀	76-80			{ 63-69 mm

Weight 3 ♂♂ 23.5-26 g (GD). 12 ♂♂ (July-Aug.) 20-25 (av. 22.7); 11 ♀♀ (July-Aug.) 18-25 (av. 21) g - SA.

COLOURS OF BARE PARTS. Iris dark brown. Bill dull orange-brown. Legs and feet purplish brown.

PLATES

PLATE I

- | | |
|---|---|
| 1 <i>Gavia arctica</i> , Blackthroated Diver (1) | 5 <i>Podiceps grisegena</i> , Rednecked Grebe (3a) |
| 2 <i>Gavia stellata</i> , Redthroated Diver (2) | 6 <i>Podiceps ruficollis</i> , Little Grebe (5) |
| 3 <i>Podiceps cristatus</i> , Great Crested Grebe (3) | 7 <i>Heliopais personata</i> , Masked Finfoot (351) |
| 4 <i>Podiceps nigricollis</i> , Blacknecked Grebe (4) | |

PLATE 2

- | | |
|--|--|
| 1 <i>Oceanites oceanicus</i> , Wilson's Storm Petrel (14) | 7 <i>Procellaria pacifica</i> , Wedgetailed Shearwater (9) |
| 2 <i>Oceanodroma leucorhoa</i> , Leach's or Forktailed Storm Petrel (16) | 8 <i>Procellaria carneipes</i> , Pinkfooted Shearwater (8) |
| 3 <i>Oceanodroma matsudairae</i> , Matsudaira's Storm Petrel (SE) | 9 <i>Procellaria tenuirostris</i> , Short-tailed Shearwater (SE) |
| 4 <i>Fregatta tropica</i> , Duskyvented Storm Petrel (15) | 10 <i>Calonestris leucomelas</i> , Streaked Shearwater (SE) |
| 5 <i>Bulweria bulwerii</i> , Bulwer's Gadfly Petrel (13b) | 11 <i>Pelagodroma marina</i> , Whitefaced Storm Petrel (SE) |
| 6 <i>Bulweria fallax</i> , Jouanin's Gadfly Petrel (13a) | 12 <i>Daption capensis</i> , Cape Petrel (6) |
| | 13 <i>Procellaria therminieri</i> , Audubon's Shearwater (11) |

PLATE 3

- 1 *Pelecanus philippensis*, Spottedbilled Pelican (21)
- 2 *Pelecanus onocrotalus*, Rosy or White Pelican (20)
- 3 *Pelecanus p. crispus*, Dalmatian Pelican (22), ssp of 21
- 4 *Fregata ariel*, Least Frigate Bird (32)
- 5 *Fregata minor*, Lesser Frigate Bird (31)

- 6 *Phoeniconaias minor*, Lesser Flamingo (74)
- 7 *Phoenicopterus roseus*, Flamingo (73)
- 8 *Cygnus cygnus*, Whooper Swan (86)
- 9 *Cygnus olor*, Mute Swan (87)
- 10 *Cygnus c. bewickii*, Bewick's Swan (84), ssp. of 86

PLATE 4

- 1 *Phalacrocorax carbo*, Cormorant (26)
- 2 *Phalacrocorax fuscicollis*, Indian Shag (27)
- 3 *Phalacrocorax niger*, Little Cormorant (28)
- 4 *Phalacrocorax pygmaeus*, Pygmy Cormorant (28a)
- 5 *Anhinga rufa*, Darter (29)

- 6 *Botaurus stellaris*, Bittern (59)
- 7 *Egretta garzetta*, Little Egret (49)
- 8 *Gorsachius melanolophus*, Malay or Tiger Bittern (53)
- 9 *Ardeola grayii*, Pond Heron or Paddybird (42)
- 10 *Nycticorax nycticorax*, Night Heron (52)

PLATE 5

- 1 *Phaethon rubricauda*, Redtailed Tropic-Bird (18)
- 2 *Phaethon aethereus*, Redbilled (or Short-tailed) Tropic-Bird (17)
- 3 *Sula dactylatra*, Masked Booby (23)

- 4 *Phaethon lepturus*, Longtailed Tropic-Bird (19)
- 5 *Sula sula*, Redfooted Booby (24)
- 6 *Sula leucogaster*, Brown Booby (25)

PLATE 6

- | | |
|---|---|
| 1 <i>Butorides striatus</i> , Little Green Heron (38) | 9 <i>Ixobrychus cinnamomeus</i> , Chestnut Bittern (56) |
| 2 <i>Ardea goliath</i> , Giant Heron (34) | 10 <i>Ixobrychus sinensis</i> , Yellow Bittern (57) |
| 3 <i>Ardea insignis</i> , Great Whitebellied Heron (33) | 11 <i>Ixobrychus minutus</i> , Little Bittern (55) |
| 4 <i>Ardea cinerea</i> , Grey Heron (36) | 12 <i>Ixobrychus flavicollis</i> , Black Bittern (58) |
| 5 <i>Ardea purpurea</i> , Purple Heron (37) | 13 <i>Botaurus stellaris</i> , Bittern (59) |
| 6 <i>Ardeola ralloides</i> , Squacco Heron (SE) | 14 <i>Nycticorax nycticorax</i> , Night Heron (52) |
| 7 <i>Ardeola bacchus</i> , Chinese Pond Heron (43) | 15 <i>Gorsachius melanolophus</i> , Malay or Tiger Bittern (53) |
| 8 <i>Ardeola grayii</i> , Pond Heron or Paddybird (42) | |

PLATE 7

- 1 *Ardea alba*, Large Egret (46)
- 2 *Egretta intermedia*, Smaller Egret (47)
- 3 *Egretta garzetta*, Little Egret (49)
- 4 *Egretta gularis*, Indian Reef Heron (50)
- 5 *Bubulcus ibis*, Cattle Egret (44)
- 6 *Grus leucogeranus*, Siberian Crane (325)

- 7 *Grus antigone*, Sarus Crane (323)
- 8 *Anthropoides virgo*, Demoiselle Crane (326)
- 9 *Grus nigricollis*, Blacknecked Crane (321)
- 10 *Grus grus*, Common Crane (320)
- 11 *Grus monacha*, Hooded Crane (322)

PLATE 8

- | | |
|--|--|
| 1 <i>Ephippiorhynchus asiaticus</i> , Blacknecked Stork (66) | 7 <i>Pseudibis papillosa</i> , Black Ibis (70) |
| 2 <i>Mycteria leucocephala</i> , Painted Stork (60) | 8 <i>Platalea leucorodia</i> , Spoonbill (72) |
| 3 <i>Ciconia ciconia</i> , White Stork (63) | 9 <i>Plegadis falcinellus</i> , Glossy Ibis (71) |
| 4 <i>Ciconia nigra</i> , Black Stork (65) | 10 <i>Leptoptilos dubius</i> , Adjutant (67) |
| 5 <i>Anastomus oscitans</i> , Openbill Stork (61) | 11 <i>Threskiornis aethiopica</i> , White Ibis (69) |
| 6 <i>Ciconia episcopus</i> , Whitenecked Stork (62) | 12 <i>Leptoptilos javanicus</i> , Lesser Adjutant (68) |

PLATE 9

- | | |
|---|--|
| 1 <i>Anas platyrhynchos</i> , Mallard (100) | 7 <i>Anas formosa</i> , Baikal Teal (95) |
| 2 <i>Anas acuta</i> , Pintail (93) | 8 <i>Marmaronetta angustirostris</i> , Marbled Teal (92) |
| 3 <i>Anas poecilorhyncha</i> , Spotbill Duck (97) | 9 <i>Anas crecca</i> , Common Teal (94) |
| 4 <i>Anas penelope</i> , Wigeon (103) | 10 <i>Anas querquedula</i> , Garganey (104) |
| 5 <i>Anas gibberifrons</i> , Grey Teal (96) | 11 <i>Anas falcata</i> , Falcated Teal (102) |
| 6 <i>Anas clypeata</i> , Shoveller (105) | 12 <i>Anas strepera</i> , Gadwall (101) |

PLATE 10
(Ducks in flight)

- | | |
|---|--|
| 1 <i>Anas platyrhynchos</i> , Mallard (100) | 7 <i>Anas formosa</i> , Baikal Teal (95) |
| 2 <i>Anas acuta</i> , Pintail (93) | 8 <i>Marmaronetta angustirostris</i> , Marbled Teal (92) |
| 3 <i>Anas poecilorhyncha</i> , Spotbill Duck (97) | 9 <i>Anas crecca</i> , Common Teal (94) |
| 4 <i>Anas penelope</i> , Wigeon (103) | 10 <i>Anas querquedula</i> , Garganey (104) |
| 5 <i>Anas gibberifrons</i> , Grey Teal (96) | 11 <i>Anas falcata</i> , Falcated Teal (102) |
| 6 <i>Anas clypeata</i> , Shoveller (105) | 12 <i>Anas strepera</i> , Gadwall (101) |

PLATE 11

- | | |
|---|--|
| 1 <i>Tadorna ferruginea</i> , Ruddy Shelduck (90) | 8 <i>Aythya marila</i> , Scaup Duck (112) |
| 2 <i>Tadorna tadorna</i> , Common Shelduck (91) | 9 <i>Aythya baeri</i> , Baer's Pochard (110) |
| 3 <i>Dendrocygna bicolor</i> , Large Whistling Teal (89) | 10 <i>Aythya nyroca</i> , White-eyed Pochard or Ferruginous Duck (109) |
| 4 <i>Dendrocygna javanica</i> , Lesser Whistling Teal or Tree Duck (88) | 11 <i>Mergus albellus</i> , Smew (119) |
| 5 <i>Netta rufina</i> , Redcrested Pochard (107) | 12 <i>Nettapus coromandelianus</i> , Cotton Teal or Quacky-Duck (114) |
| 6 <i>Aythya ferina</i> , Common Pochard (108) | 13 <i>Rhodonessa caryophyllacea</i> , Pinkheaded Duck (106) |
| 7 <i>Aythya fuligula</i> , Tufted Duck (111) | |

PLATE 12

- 1 *Oxyura leucocephala*, Whiteheaded Stiff-tailed Duck (123)
- 2 *Bucephala clangula*, Goldeneye Duck (118)
- 3 *Clangula hyemalis*, Longtail or Old Squaw Duck (117)
- 4 *Mergus merganser*, Goosander or Common Merganser (121)
- 5 *Sarkidiornis melanotos*, Comb Duck (115)

- 6 *Cairina scutulata*, Whitewinged Wood Duck (116)
- 7 *Branta ruficollis*, Siberian Redbreasted Goose (75)
- 8 *Anser erythropus*, Lesser Whitefronted Goose (80)
- 9 *Anser fabalis*, Bean Goose (76)
- 10 *Anser albifrons*, Whitefronted Goose (79)
- 11 *Anser anser*, Greylag Goose (81)
- 12 *Anser indicus*, Barheaded Goose (82)

| 2 <i>Tadorna tadorna</i> , Common Shelduck (91) | 10 <i>Mergus albellus</i> , Smew (119) |
| 3 <i>Dendrocygna bicolor</i> , Large Whistling Teal (89) | 11 <i>Mergus merganser</i> , Goosander or Common Merganser (121) |
| 4 <i>Dendrocygna javanica</i> , Lesser Whistling Teal or Tree Duck (88) | 12 <i>Nettion coromandelianus</i> , Cotton Teal or Quack-Duck (114) |
| 5 <i>Netta rufina</i> , Redcrested Pochard (107) | 13 <i>Oxyura leucocephala</i> , Whiteheaded Stiff-tailed Duck (123) |
| 6 <i>Aythya ferina</i> , Common Pochard (108) | |
| 7 <i>Aythya fuligula</i> , Tufted Duck (111) | |
| 8 <i>Aythya nyroca</i> , White-eyed Pochard or Ferruginous Duck (109) | |

John M. Dick

PLATE 14

- 1 *Haliaeetus leucogaster*, Whitebellied Sea Eagle (173)
- 2 *Ichthyophaga ichthyaetus*, Greyheaded Fishing Eagle (175)
- 3 *Ichthyophaga nana*, Himalayan Greyheaded Fishing Eagle (177)
- 4 *Haliaeetus albicilla*, Whitetailed Eagle (172a)
- 5 *Haliaeetus leucoryphus*, Pallas's Fishing Eagle (174)
- 6 *Pandion haliaetus*, Osprey (203)
- 7 *Milvus m. govinda*, Pariah Kite (133), ssp of 132
- 8 *Milvus migrans*, Black Kite (132)
- 9 *Milvus m. lineatus*, Blackeared or Large Indian Kite (134), ssp of 132
- 10 *Milvus milvus*, Red Kite (131)
- 11 *Haliastur indus*, Brahminy Kite (135)
- 12 *Circus melanoleucos*, Pied Harrier (192)
- 13 *Circus macrourus*, Pale Harrier (190)
- 14 *Circus aeruginosus*, Marsh Harrier (193)

John H. Dick

PLATE 15
(Kites and Eagles in flight)

- | | |
|---|---|
| 1 <i>Milvus milvus</i> , Red Kite (131) | 6 <i>Haliaeetus leucogaster</i> , Whitebellied Sea Eagle (173) |
| 2 <i>Milvus m. lineatus</i> , Blackeared or Large Indian Kite (134), ssp of 132 | 7 <i>Ichthyophaga ichthyaeetus</i> , Greyheaded Fishing Eagle (175) |
| 3 <i>Milvus m. govinda</i> , Pariah Kite (133), ssp of 132 | 8 <i>Haliaeetus albicilla</i> , Whitetailed Eagle (172a) |
| 4 <i>Milvus migrans</i> , Black Kite (132) | 9 <i>Haliaeetus leucoryphus</i> , Pallas's Fishing Eagle (174) |
| 5 <i>Ichthyophaga nana</i> , Himalayan Greyheaded Fishing Eagle (177) | |

John H. Dietz

PLATE 16

- | | |
|--|---|
| 1 <i>Neophron percnopterus</i> , Egyptian or Scavenger Vulture (186) | 4 <i>Gyps indicus</i> , Indian Longbilled Vulture (182) |
| 2 <i>Gypaetus barbatus</i> , Bearded Vulture or Lämmergeier (188) | 5* <i>Gyps fulvus</i> , Griffon Vulture (180) |
| 3 <i>Gyps bengalensis</i> , Indian Whitebacked Vulture (185) | 6 <i>Aegypius monachus</i> , Cinereous Vulture (179) |
| | 7 <i>Sarcogyps calvus</i> , Black or King Vulture (178) |
| | 8 <i>Gyps himalayensis</i> , Himalayan Griffon (181) |

* No. 5 is repeated because since this plate was painted the two subspecies shown in the plate have been synonymized.

| 1 <i>Rallus aquaticus</i> , Water Rail (327) | 12 <i>Rallina canningi</i> , Andaman Banded Crake (333) |
| 2 <i>Rallus striatus</i> , Bluebreasted Banded Rail (329) | 13 <i>Gallix rex cinerea</i> , Water Cock (346) |
| 3 <i>Rallina fasciata</i> , Redlegged Banded Crake (331) | 14 <i>Gallinula chloropus</i> , Moorhen (347) |
| 4 <i>Porzana parva</i> , Little Crake (335) | 15 <i>Fulica atra</i> , Coot (350) |
| 5 <i>Rallina eurizonoides</i> , Banded Crake (332) | 16 <i>Hydrophasianus chirurgus</i> , Pheasant-tailed Jacana (358) |
| 6 <i>Porzana pusilla</i> , Baillon's Crake (337) | 17 <i>Amauornis phoenicurus</i> , Whitebreasted Waterhen (343) |
| 7 <i>Crex crex</i> , Corn Crake (334) | 18 <i>Metopidius indicus</i> , Bronzewinged Jacana (359) |
| 8 <i>Porzana porzana</i> , Spotted Crake (338) | 19 <i>Porphyrio porphyrio</i> , Purple Moorhen (319) |
| 9 <i>Porzana fusca</i> , Ruddy Crake (339) | |
| 10 <i>Amauornis akool</i> , Brown Crake (342) | |
| 11 <i>Amauornis bicolor</i> , Elwes's Crake (341) | |

PLATE 37

- | | |
|--|--|
| 1 <i>Otis tetrax</i> , Little Bustard (353) | 4 <i>Chlamydotis undulata</i> , Houbara (355) |
| 2 <i>Otis tarda</i> , Great Bustard (352) | 5 <i>Choriotis nigriceps</i> , Great Indian Bustard (354) |
| 3 <i>Eupodotis bengalensis</i> , Bengal Florican (356) | 6 <i>Syphieotides indica</i> , Likh or Lesser Florican (357) |

PLATE 38

- | | |
|---|---|
| 1 <i>Cursorius cursor</i> , Creamcoloured Courser (439) | 8 <i>Rostratula benghalensis</i> , Painted Snipe (429) |
| 2 <i>Cursorius coromandelicus</i> , Indian Courser (440) | 9 <i>Vanellus vanellus</i> , Lapwing (364) |
| 3 <i>Cursorius bitorquatus</i> , Jerdon's or Doublebanded Courser (441) | 10 <i>Vanellus spinosus</i> , Spurwinged Lapwing (369) |
| 4 <i>Glareola pratincola</i> , Collared Pratincole (443) | 11 <i>Vanellus indicus</i> , Redwattled Lapwing (366) |
| 5 <i>Glareola lactea</i> , Small Indian Pratincole (444) | 12 <i>Vanellus cinereus</i> , Greyheaded Lapwing (365) |
| 6 <i>Pluvialis squatarola</i> , Grey or Blackbellied Plover (371) | 13 <i>Vanellus malabaricus</i> , Yellow-wattled Lapwing (370) |
| 7 <i>Pluvialis dominica</i> , Eastern Golden Plover (373) | 14 <i>Vanellus leucurus</i> , Whitetailed Lapwing (362) |
| | 15 <i>Vanellus gregarius</i> , Sociable Lapwing (363) |

PLATE 39

- | | |
|--|--|
| 1 <i>Vanellus vanellus</i> , Lapwing (364) | 10 <i>Limosa limosa</i> , Blacktailed Godwit (389) |
| 2 <i>Vanellus indicus</i> , Redwattled Lapwing (366) | 11 <i>Limosa lapponica</i> , Bartailed Godwit (391) |
| 3 <i>Vanellus cinereus</i> , Greyheaded Lapwing (365) | 12 <i>Limnodromus semipalmatus</i> , Snipebilled Godwit or Asian Dowitcher (403) |
| 4 <i>Vanellus leucurus</i> , Whitetailed Lapwing (362) | 13 <i>Numenius arquata</i> , Curlew (388) |
| 5 <i>Haematopus ostralegus</i> , Oystercatcher (360) | 14 <i>Burhinus oedicephalus</i> , Stone Curlew (436) |
| 6 <i>Recurvirostra avosetta</i> , Avocet (432) | 15 <i>Esacus magnirostris</i> , Great Stone Plover (437) |
| 7 <i>Dromas ardeola</i> , Crab Plover (434) | 16 <i>Ibidorhyncha struthersii</i> , Ibisbill (433) |
| 8 <i>Himantopus himantopus</i> , Blackwinged Stilt (430) | |
| 9 <i>Numenius phaeopus</i> , Whimbrel (385) | |

PLATE 40

- | | |
|---|--|
| 1 <i>Charadrius placidus</i> , Longbilled Ringed Plover (383) | 11 <i>Calidris acuminata</i> , Asian Pectoral Sandpiper (419) |
| 2 <i>Charadrius hiaticula</i> , Ringed Plover (378) | 12 <i>Calidris tenuirostris</i> , Eastern Knot (413) |
| 3 <i>Charadrius dubius</i> , Little Ringed Plover (380) | 13 <i>Calidris canuta</i> , Knot (412) |
| 4 <i>Charadrius alexandrinus</i> , Kentish Plover (381) | 14 <i>Calidris alpina</i> , Dunlin (420) |
| 5 <i>Charadrius mongolus</i> , Lesser Sand Plover (384) | 15 <i>Calidris testacea</i> , Curlew-Sandpiper (422) |
| 6 <i>Charadrius leschanaultii</i> , Large Sand Plover (374) | 16 <i>Limicola falcinellus</i> , Broadbilled Sandpiper (424) |
| 7 <i>Charadrius asiaticus</i> , Caspian Sand Plover (376) | 17 <i>Phalaropus lobatus</i> , Rednecked Phalarope (428) |
| 8 <i>Calidris minuta</i> , Little Stint (416) | 18 <i>Eurynorhynchus pygmeus</i> , Spoonbilled Sandpiper (423) |
| 9 <i>Calidris temminckii</i> , Temminck's Stint (417) | 19 <i>Calidris alba</i> , Sanderling (414) |
| 10 <i>Calidris subminuta</i> , Longtoed Stint (418) | |

PLATE 41
(Waders in flight)

|---|---|
| 1 <i>Charadrius hiaticula</i> , Ringed Plover (378) | 10 <i>Calidris canuta</i> , Knot (412) |
| 2 <i>Charadrius dubius</i> , Little Ringed Plover (380) | 11 <i>Calidris tenuirostris</i> , Eastern Knot (413) |
| 3 <i>Charadrius alexandrinus</i> , Kentish Plover (381) | 12 <i>Phalaropus lobatus</i> , Rednecked Phalarope (428) |
| 4 <i>Charadrius mongolus</i> , Lesser Sand Plover (384) | 13 <i>Gallinago gallinago</i> , Fantail Snipe (409) |
| 5 <i>Calidris alba</i> , Sanderling (414) | 14 <i>Scolopax rusticola</i> , Woodcock (411) |
| 6 <i>Calidris alpina</i> , Dunlin (420) | 15 <i>Gallinago stenura</i> , Pintail Snipe (406) |
| 7 <i>Calidris testacea</i> , Curlew-Sandpiper (422) | 16 <i>Rostratula benghalensis</i> , Painted Snipe (429) |
| 8 <i>Calidris minuta</i> , Little Stint (416) | 17 <i>Cursorius cursor</i> , Creamcoloured Courser (439) |
| 9 <i>Calidris temminckii</i> , Temminck's Stint (417) | 18 <i>Cursorius coromandelicus</i> , Indian Courser (440) |

PLATE 42

- | | |
|---|--|
| 1 <i>Haematopus ostralegus</i> , Oystercatcher (360) | 7 <i>Numenius phaeopus</i> , Whimbrel (385) |
| 2 <i>Limnodromus semipalmatus</i> , Snipebilled Godwit or Asian Dowitcher (403) | 8 <i>Himantopus himantopus</i> , Blackwinged Stilt (430) |
| 3 <i>Ibidorhyncha struthersii</i> , Ibisbill (433) | 9 <i>Dromas ardeola</i> , Crab Plover (434) |
| 4 <i>Numenius arquata</i> , Curlew (388) | 10 <i>Recurvirostra avosetta</i> , Avocet (432) |
| 5 <i>Limosa limosa</i> , Blacktailed Godwit (389) | 11 <i>Burhinus oedinenus</i> , Stone Curlew (436) |
| 6 <i>Limosa lapponica</i> , Bartailed Godwit (391) | 12 <i>Esacus magnirostris</i> , Great Stone Plover (437) |

PLATE 43

- | | |
|---|---|
| 1 <i>Tringa totanus</i> , Redshank (393) | 8 <i>Arenaria interpres</i> , Turnstone (402) |
| 2 <i>Tringa stagnatilis</i> , Marsh Sandpiper (395) | 9 <i>Tringa hypoleucos</i> , Common Sandpiper (401) |
| 3 <i>Tringa nebularia</i> , Greenshank (396) | 10 <i>Gallinago minima</i> , Jack Snipe (410) |
| 4 <i>Tringa guttifer</i> , Spotted Greenshank (399) | 11 <i>Gallinago gallinago</i> , Fantail Snipe (409) |
| 5 <i>Tringa glareola</i> , Wood Sandpiper (398) | 12 <i>Philomachus pugnax</i> , Ruff and Reeve (426) |
| 6 <i>Tringa ochropus</i> , Green Sandpiper (397) | 13 <i>Scolopax rusticola</i> , Woodcock (411) |
| 7 <i>Tringa terek</i> , Terek Sandpiper (400) | |

PLATE 44
(Waders in flight)

- | | |
|--|--|
| 1 <i>Pluvialis squatarola</i> , Grey Plover (371) | 8 <i>Tringa ochropus</i> , Green Sandpiper (397) |
| 2 <i>Glareola pratincola</i> , Collared Pratincole (442) | 9 <i>Tringa erythropus</i> , Spotted or Dusky Redshank (392) |
| 3 <i>Glareola p. maldivarum</i> (Oriental) Collared Pratincole (443), ssp of 442 | 10 <i>Tringa nebularia</i> , Greenshank (396) |
| 4 <i>Glareola lactea</i> , Small Indian Pratincole (444) | 11 <i>Tringa glareola</i> , Wood Sandpiper (398) |
| 5 <i>Pluvialis apricaria</i> , Golden Plover (372) | 12 <i>Tringa totanus</i> , Redshank (393) |
| 6 <i>Arenaria interpres</i> , Turnstone (402) | 13 <i>Tringa hypoleucos</i> , Common Sandpiper (401) |
| 7 <i>Pluvialis dominica</i> , Eastern Golden Plover (373) | 14 <i>Tringa terek</i> , Terek Sandpiper (400) |
| | 15 <i>Philomachus pugnax</i> , Ruff and Reeve (426) |

PLATE 45

- | | |
|--|---|
| 1 <i>Catharacta skua antarctica</i> , Antarctic Skua (445) | 6 <i>Larus ichthyaetus</i> , Great Blackheaded Gull (453) |
| 2 <i>Stercorarius pomarinus</i> , Pomatorhine Skua or Jaeger (447) | 7 <i>Larus hemprichii</i> , Sooty Gull (449) |
| 3 <i>Rynchops albicollis</i> , Indian Skimmer (484) | 8 <i>Larus argentatus</i> , Herring Gull (450) |
| 4 <i>Catharacta skua maccormicki</i> , (Maccormick's Skua) Antarctic Skua (446a) | 9 <i>Larus fuscus</i> , Lesser Blackbacked Gull (452) |
| 5 <i>Stercorarius parasiticus</i> , Parasitic or Richardson's Skua or Jaeger (448) | 10 <i>Larus minutus</i> , Little Gull (457) |
| | 11 <i>Larus ridibundus</i> , Blackheaded Gull (455) |
| | 12 <i>Larus genei</i> , Slenderbilled Gull (456) |
| | 13 <i>Larus brunnicephalus</i> , Brownheaded Gull (454) |

PLATE 46

- | | |
|---|---|
| 1 <i>Chlidonias niger</i> , Black Tern (459a) | 10 <i>Hydroprogne caspia</i> , Caspian Tern (462) |
| 2 <i>Chlidonias leucopterus</i> , Whitewinged Black Tern (459) | 11 <i>Sterna bergii</i> , Large Crested Tern (478) |
| 3 <i>Chlidonias hybrida</i> , Whiskered Tern (458) | 12 <i>Sterna sumatrana</i> , Blacknaped Tern (468) |
| 4 <i>Sterna albifrons</i> , Little Tern (475) | 13 <i>Sterna acuticauda</i> , Blackbellied Tern (470) |
| 5 <i>Gygis alba</i> , Indian Ocean White Tern or Fairy Tern (483) | 14 <i>Sterna bengalensis</i> , Indian Lesser Crested Tern (479) |
| 6 <i>Sterna dougallii</i> , Roseate or Rosy Tern (466) | 15 <i>Gelochelidon nilotica</i> , Gullbilled Tern (460) |
| 7 <i>Sterna repressa</i> , Whitecheeked Tern (467) | 16 <i>Sterna fuscata</i> , Sooty Tern (474) |
| 8 <i>Sterna hirundo</i> , Common Tern (464) | 17 <i>Anous stolidus</i> , Noddy Tern (481) |
| 9 <i>Sterna aurantia</i> , Indian River Tern (463) | 18 <i>Sterna sandwicensis</i> , Sandwich Tern (480) |
| | 19 <i>Sterna anaethetus</i> , Brownwinged Tern (471) |

PLATE 47

- 1 *Pterocles orientalis*, Imperial Sandgrouse (489)
- 2 *Pterocles coronatus*, Coronetted Sandgrouse (490)
- 3 *Pterocles i. arabicus*, Closebarred Sandgrouse (491),
ssp of 492
- 4 *Pterocles exustus*, Indian Sandgrouse (487)

- 5 *Pterocles indicus*, Painted Sandgrouse (492)
- 6 *Pterocles senegallus*, Spotted Sandgrouse (488)
- 7 *Pterocles alchata*, Large Pintail Sandgrouse (486)
- 8 *Syrhaptes paradoxus*, Pallas's Sandgrouse (485a)
- 9 *Syrhaptes tibetanus*, Tibetan Sandgrouse (485)

PLATE 48

- | | |
|---|---|
| 1 <i>Columba livia</i> , Blue Rock Pigeon (517) | 9 <i>Ducula aenea</i> , Green Imperial Pigeon (506) |
| 2 <i>Columba oenas</i> , Stock Pigeon (SE) | 10 <i>Ducula bicolor</i> , Pied Imperial Pigeon (509) |
| 3 <i>Columba eversmanni</i> , Eastern Stock Pigeon (518) | 11 <i>Columba punicea</i> , Purple Wood Pigeon (524) |
| 4 <i>Columba rupestris</i> , Hill Pigeon (515) | 12 <i>Columba torringtoni</i> , Ceylon Wood Pigeon (522) |
| 5 <i>Columba leuconota</i> , Snow Pigeon (513) | 13 <i>Columba palumboides</i> , Andaman Wood Pigeon (525) |
| 6 <i>Columba palumbus</i> , Wood Pigeon (519) | 14 <i>Columba hodgsonii</i> , Speckled Wood Pigeon (520) |
| 7 <i>Columba elphinstonii</i> , Nilgiri Wood Pigeon (521) | 15 <i>Ducula badia</i> , Imperial Pigeon (510) |
| 8 <i>Columba pulchricollis</i> , Ashy Wood Pigeon (523) | |

PLATE 49

- | | |
|---|--|
| 1 <i>Treron sphenura</i> , Wedgetailed Green Pigeon (494) | 9 <i>Chalcophaps indica</i> , Emerald or Bronzewinged Dove (542) |
| 2 <i>Treron phoenicoptera</i> , Yellowlegged Green Pigeon (503) | 10 <i>Macropygia rufipennis</i> , Andaman Cuckoo-Dove (527) |
| 3 <i>Treron pompadora</i> , Pompadour or Greyfronted Green Pigeon (496) | 11 <i>Streptopelia tranquebarica</i> , Red Turtle Dove (535) |
| 4 <i>Treron curvirostra</i> , Thickbilled Green Pigeon (495) | 12 <i>Streptopelia decaocto</i> , Indian Ring Dove (534) |
| 5 <i>Treron apicauda</i> , Pintailed Green Pigeon (493) | 13 <i>Streptopelia senegalensis</i> , Little Brown or Senegal Dove (541) |
| 6 <i>Treron bicincta</i> , Orangebreasted Green Pigeon (501) | 14 <i>Streptopelia chinensis</i> , Spotted Dove (537) |
| 7 <i>Caloenas nicobarica</i> , Nicobar Pigeon (544b) | 15 <i>Streptopelia turtur</i> , Turtle Dove (529) |
| 8 <i>Macropygia unchall</i> , Bartailed Cuckoo-Dove (526) | 16 <i>Streptopelia orientalis</i> , Rufous Turtle Dove (532) |

PLATE 50

- | | |
|--|--|
| 1 <i>Psittacula caniceps</i> , Nicobar Parakeet (553) | 8 <i>Psittacula longicauda</i> , Redchecked Parakeet (555) |
| 2 <i>Psittacula derbyana</i> , Lord Derby's Parakeet (554) | 9 <i>Psittacula krameri</i> , Roseringed Parakeet (550) |
| 3 <i>Psittacula eupatria</i> , Alexandrine Parakeet (546) | 10 <i>Psittacula columboides</i> , Bluewinged Parakeet (564) |
| 4 <i>Psittacula finschii</i> , Eastern Slatyheaded Parakeet (563) | 11 <i>Psittacula alexandri</i> , Redbreasted Parakeet (551) |
| 5 <i>Psittacula cyanocephala</i> , Blossomheaded Parakeet (558) | 12 <i>Psittacula calthropae</i> , Layard's Parakeet (565) |
| 6 <i>Psittacula himalayana</i> , Slatyheaded Parakeet (562) | 13 <i>Loriculus beryllinus</i> , Ceylon Lorikeet (568) |
| 7 <i>Psittacula roseata</i> , Eastern Blossomheaded Parakeet (559) | 14 <i>Loriculus vernalis</i> , Indian Lorikeet (566) |

PLATE 51

- | | |
|---|---|
| 1 <i>Cuculus sparveroides</i> , Large Hawk-Cuckoo (572) | 6 <i>Cacomantis sonneratii</i> , Indian Banded Bay Cuckoo (582) |
| 2 <i>Cuculus fugax</i> , Hodgson's Hawk-Cuckoo (575) | 7 <i>Chalcites xanthorhynchus</i> , Violet Cuckoo (587) |
| 3 <i>Cuculus varius</i> , Common Hawk-Cuckoo or Brainfever Bird (573) | 8 <i>Cacomantis passerinus</i> , Indian Plaintive Cuckoo (584) |
| 4 <i>Chalcites maculatus</i> , Emerald Cuckoo (586) | 9 <i>Cuculus poliocephalus</i> , Small Cuckoo (581) |
| 5 <i>Cacomantis merulinus</i> , Rufousbellied Plaintive Cuckoo (585) | 10 <i>Cuculus micropterus</i> , Indian Cuckoo (576) |
| | 11 <i>Cuculus canorus</i> , The Cuckoo (578) |

PLATE 52

- | | |
|---|---|
| 1 <i>Rhopodytes viridirostris</i> , Small Greenbilled Malkoha (595) | 6 <i>Centropus toulou</i> , Lesser Coucal (605) |
| 2 <i>Clamator jacobinus</i> , Pied Crested Cuckoo (571) | 7 <i>Phaenicophaeus pyrrhocephalus</i> , Redfaced Malkoha (599) |
| 3 <i>Clamator coromandus</i> , Redwinged Crested Cuckoo (569) | 8 <i>Centropus sinensis</i> , Crow-Pheasant or Coucal (600) |
| 4 <i>Rhopodytes tristis</i> , Large Greenbilled Malkoha (593) | 9 <i>Centropus chlororhynchus</i> , Ceylon Coucal (604) |
| 5 <i>Taccocua leschenaultii</i> , Sirkeer Cuckoo (598) | 10 <i>Centropus (sinensis) andamanensis</i> , Andaman Crow-Pheasant (603) |

PLATE 53

- | | |
|--|--|
| 1 <i>Bubo bubo</i> , Eagle-Owl or Great Horned Owl (627) | 7 <i>Asio flammeus</i> , Shorteared Owl (664) |
| 2 <i>Bubo nipalensis</i> , Forest Eagle-Owl (628) | 8 <i>Bubo zeylonensis</i> , Brown Fish Owl (631) |
| 3 <i>Bubo coromandus</i> , Dusky Horned Owl (630) | 9 <i>Strix aluco</i> , Himalayan Wood Owl (662) |
| 4 <i>Strix leptogrammica</i> , Brown Wood Owl (659) | 10 <i>Strix butleri</i> , Hume's Wood Owl (654) |
| 5 <i>Strix ocellata</i> , Mottled Wood Owl (657) | 11 <i>Bubo flavipes</i> , Tawny Fish Owl (633) |
| 6 <i>Asio otus</i> , Longeared Owl (663) | |

PLATE 54

- | | |
|---|--|
| 1 <i>Otus brucei</i> , Striated, or Pallid, Scops Owl (614) | 10 <i>Athene noctua</i> , Little Owl (648) |
| 2 <i>Otus spilocephalus</i> , Spotted Scops Owl (612) | 11 <i>Athene blewitti</i> , Forest Spotted Owlet (653) |
| 3 <i>Otus scops</i> , Scops Owl (617) | 12 <i>Athene brama</i> , Spotted Owlet (652) |
| 4 <i>Otus bakkamoena</i> , Collared Scops Owl (623) | 13 <i>Ninox s. obscura</i> (645), ssp of 642 |
| 5 <i>Glaucidium r. castanonotum</i> (638), ssp of 636 | 14 <i>Ninox scutulata</i> , Brown Hawk-Owl (642) |
| 6 <i>Glaucidium cuculoides</i> , Barred Owlet (639) | 15 <i>Phodilus badius</i> , Bay Owl (609) |
| 7 <i>Glaucidium brodiei</i> , Collared Pigmy Owlet (635) | 16 <i>Tyto alba</i> , Barn Owl (606) |
| 8 <i>Glaucidium radiatum</i> , Jungle Owlet (636) | 17 <i>Tyto capensis</i> , Grass Owl (608) |
| 9 <i>Aegolius funereus</i> , Tengmalm's Owl or Boreal Owl (665) | |

PLATE 55

- | | |
|--|--|
| 1 <i>Batrachostomus moniliger</i> , Ceylon Frogmouth (666) | 7 <i>Caprimulgus affinis</i> , Franklin's or Allied Nightjar (682) |
| 2 <i>Batrachostomus hodgsoni</i> , Hodgson's Frogmouth (667) | 8 <i>Caprimulgus asiaticus</i> , Common Indian Nightjar (680) |
| 3 <i>Caprimulgus mahrattensis</i> , Sykes's Nightjar (674) | 9 <i>Caprimulgus macrurus</i> , Longtailed Nightjar (675) |
| 4 <i>Caprimulgus europaeus</i> , European Nightjar (673) | 10 <i>Eurostopodus macrotis</i> , Great Eared Nightjar (669) |
| 5 <i>Caprimulgus aegyptius</i> , Egyptian Nightjar (673a) | |
| 6 <i>Caprimulgus indicus</i> , Indian Jungle Nightjar (671) | |

PLATE 56

- | | |
|--|---|
| 1 <i>Chaetura sylvatica</i> , Whiterumped Spinetail (692) | 10 <i>Chaetura gigantea</i> , Large Brownthroated Spinetail Swift (691) |
| 2 <i>Collocalia brevirostris</i> , Himalayan Swiftlet (683) | 11 <i>Chaetura cochinchinensis</i> , Cochinchina Spinetail Swift (690) |
| 3 <i>Collocalia esculenta</i> , Whitebellied Swiftlet (687) | 12 <i>Apus melba</i> , Alpine Swift (693) |
| 4 <i>Apus affinis</i> , House Swift (703) | 13 <i>Cypsiurus parvus</i> , Palm Swift (707) |
| 5 <i>Apus pallidus</i> , Pallid Swift (697) | 14 <i>Chaetura caudacuta</i> , Whitethroated Spinetail Swift (688) |
| 6 <i>Apus apus</i> , The Swift (696) | |
| 7 <i>Apus pacificus</i> , Large Whiterumped Swift (699) | |
| 8 <i>Collocalia unicolor</i> , Indian Edible-nest Swiftlet (685) | |
| 9 <i>Apus acuticauda</i> , Darkbacked Swift (698) | |

PLATE 57

- | | |
|---|--|
| 1 <i>Harpactes erythrocephalus</i> , Redheaded Trogon (715) | 7 <i>Merops apiaster</i> , European Bee-eater (746) |
| 2 <i>Harpactes wardi</i> , Ward's Trogon (716) | 8 <i>Coracias garrulus</i> , European Roller (754) |
| 3 <i>Harpactes fasciatus</i> , Malabar Trogon (711) | 9 <i>Merops philippinus</i> , Bluetailed Bee-eater (748) |
| 4 <i>Merops leschenaulti</i> , Chestnutheaded Bee-eater (744) | 10 <i>Merops orientalis</i> , Green Bee-eater (750) |
| 5 <i>Nyctornis athertoni</i> , Bluebearded Bee-eater (753) | 11 <i>Coracias benghalensis</i> , Indian Roller (755) |
| 6 <i>Merops superciliosus</i> , Bluecheeked Bee-eater (747) | 12 <i>Eurystomus orientalis</i> , Broadbilled Roller (758) |

PLATE 58

- 1 *Ceryle lugubris*, Himalayan Pied Kingfisher (717)
- 2 *Ceryx e. rufidorsus*? (727a), ssp of 727?
- 3 *Ceryle rudis*, Lesser Pied Kingfisher (719)
- 4 *Ceryx erithacus*, Threetoed Kingfisher (727)
- 5 *Alcedo meninting*, Blue-eared Kingfisher (725)
- 6 *Alcedo atthis*, Common, or Small Blue, Kingfisher (723)
- 7 *Alcedo hercules*, Blyth's, or Great Blue, Kingfisher (721)

- 8 *Halcyon pileata*, Blackcapped Kingfisher (739)
- 9 *Pelargopsis capensis*, Storkbilled Kingfisher (730)
- 10 *Halcyon chloris*, Whitecollared Kingfisher (740)
- 11 *Halcyon coromanda*, Ruddy Kingfisher (733)
- 12 *Pelargopsis amauroptera*, Brownwinged Kingfisher (729)
- 13 *Halcyon smymensis*, Whitebreasted Kingfisher (736)
- 14 *Upupa epops*, Hoopoe (763)

PLATE 59

- 1 *Rhyticeros plicatus*, Narcondam Hornbill (773)
- 2 *Tockus birostris*, Common Grey Hornbill (767)
- 3 *Ptilolaemus tickelli*, Whitethroated Brown Hornbill (770)
- 4 *Buceros bicornis*, Great Pied Hornbill (776)

- 5 *Tockus griseus*, Malabar Grey Hornbill (768)
- 6 *Anthracoseros malabaricus*, Indian Pied Hornbill (774)
- 7 *Rhyticeros undulatus*, Wreathed Hornbill (772)
- 8 *Anthracoseros coronatus*, Malabar Pied Hornbill (775)
- 9 *Aceros nipalensis*, Rufousnecked Hornbill (771)

PLATE 60

- | | |
|---|---|
| 1 <i>Megalaima lineata</i> , Lineated Barbet (784) | 11 <i>Megalaima australis</i> , Blue-eared Barbet (789) |
| 2 <i>Megalaima viridis</i> , Small Green Barbet (785) | 12 <i>Chrysocolaptes festivus</i> , Blackbacked Woodpecker (858) |
| 3 <i>Megalaima zeylanica</i> , Large Green Barbet (782) | 13 <i>Dinopium benghalense</i> , Lesser Goldenbacked Woodpecker (819) |
| 4 <i>Megalaima virens</i> , Great Hill Barbet (778) | 14 <i>Dinopium b. psarodes</i> (823), ssp of 819 |
| 5 <i>Megalaima asiatica</i> , Bluethroated Barbet (788) | 15 <i>Dinopium shorii</i> , Himalayan Goldenbacked Threetoed Woodpecker (824) |
| 6 <i>Megalaima franklinii</i> , Goldenthroated Barbet (787) | 16 <i>Dinopium javanense</i> , Indian Goldenbacked Threetoed Woodpecker (825) |
| 7 <i>Megalaima flavifrons</i> , Yellowfronted Barbet (786) | 17 <i>Chrysocolaptes lucidus</i> , Larger Goldenbacked Woodpecker (861) |
| 8 <i>Megalaima haemacephala</i> , Crimsonbreasted Barbet or Coppersmith (792) | 18 <i>Chrysocolaptes l. stricklandi</i> (863), ssp of 861 |
| 9 <i>Megalaima r. malabarica</i> (790), ssp of 791 | |
| 10 <i>Megalaima rubricapilla</i> , Crimsonthroated Barbet (791) | |

PLATE 61

- | | |
|---|--|
| 1 <i>Dendrocopos moluccensis</i> , Browncapped Woodpecker (SE) | 11 <i>Hypopicus hyperythrus</i> , Rufousbellied Woodpecker or Sapsucker (833) |
| 2 <i>Picumnus innominatus</i> , Speckled Piculet (798) | 12 <i>Picoides assimilis</i> , Sind Pied Woodpecker (835) |
| 3 <i>Picoides canicapillus</i> , Greycrowned Pigmy Woodpecker (850) | 13 <i>Picoides cathpharius</i> , Crimsonbreasted Pied Woodpecker (840) |
| 4 <i>Hemicircus canente</i> , Heartspotted Woodpecker (856) | 14 <i>Picoides major</i> , Great Spotted, or Redcrowned Pied, Woodpecker (834) |
| 5 <i>Sasia ochracea</i> , Rufous Piculet (800) | 15 <i>Picoides himalayensis</i> , Himalayan Pied Woodpecker (837) |
| 6 <i>Picoides auriceps</i> , Brownfronted Pied Woodpecker (842) | 16 <i>Picoides h. albens</i> (836), ssp of 837 |
| 7 <i>Picoides tridactylus</i> , Threetoed Woodpecker (855) | 17 <i>Dendrocopos leucopterus</i> , Whitemantled Woodpecker (SE) |
| 8 <i>Picoides atratus</i> , Stripebreasted Pied Woodpecker (844) | 18 <i>Picoides darjellensis</i> , Darjeeling Pied Woodpecker (838) |
| 9 <i>Picoides maharattensis</i> , Yellowfronted Pied Woodpecker (847) | |
| 10 <i>Picoides macei</i> , Fulvousbreasted Pied Woodpecker (845) | |

PLATE 62

- 1 *Jynx torquilla*, Wryneck (796)
- 2 *Picus chlorolophus*, Small Yellownaped Woodpecker (815)
- 3 *Picus e. chlorigaster* (816), ssp of 815
- 4 *Picus flavinucha*, Large Yellownaped Woodpecker (813)
- 5 *Picus canus*, Blacknaped Green Woodpecker (809)
- 6 *Picus squamatus*, Scalybellied Green Woodpecker (807)
- 7 *Picus pyrrhotis*, Little Scalybellied Green Woodpecker (808)
- 8 *Dryocopus javensis*, Indian Great Black Woodpecker (830)
- 9 *Dryocopus j. hodgei* (831), ssp of 830
- 10 *Mulleripicus pulverulentus*, Himalayan Great Slaty Woodpecker (828)
- 11 *Picus vittatus*, Laced Woodpecker (SE)
- 12 *Gecinulus grantia*, Paleheaded Woodpecker (827)
- 13 *Blythipicus pyrrhotis*, Redeared Bay Woodpecker (857)

PLATE 63

- | | |
|---|--|
| 1 <i>Psarisomus dalhousiae</i> , Longtailed Broadbill (865) | 7 <i>Oriolus traillii</i> , Maroon Oriole (961) |
| 2 <i>Oriolus oriolus</i> , Golden Oriole (953) | 8 <i>Pitta cyanea</i> , Blue Pitta (871) |
| 3 <i>Serilophus lunatus</i> , Collared Broadbill (864) | 9 <i>Pitta sordida</i> , Hooded or Greenbreasted Pitta (869) |
| 4 <i>Oriolus xanthornus</i> , Blackheaded Oriole (958) | 10 <i>Pitta nipalensis</i> , Bluenaped Pitta (866) |
| 5 <i>Oriolus chinensis diffusus</i> , Blacknaped Oriole (954) | 11 <i>Pitta moluccensis</i> , Bluewinged Pitta (868) |
| 6 <i>Oriolus chinensis tenuirostris</i> , Slenderbilled Blacknaped Oriole (955) | 12 <i>Pitta brachyura</i> , Indian Pitta (867) |

PLATE 64

- | | |
|---|---|
| 1 <i>Mirafrja javanica</i> , Singing Bush Lark (872) | 12 <i>Melanocorypha calandra</i> , Calandra Lark (SE) |
| 2 <i>Mirafrja assamica</i> , Bush Lark (873) | 13 <i>Calandrella rufescens</i> , Lesser Short-toed Lark (888a) |
| 3 <i>Mirafrja a. affinis</i> (874), ssp of 873 | 14 <i>Calandrella cinerea</i> , Short-toed Lark (886) |
| 4 <i>Mirafrja erythroptera</i> , Redwinged Bush Lark (877) | 15 <i>Calandrella raytal</i> , Sand Lark (891) |
| 5 <i>Eremopterix grisea</i> , Ashycrowned Finch-Lark (878) | 16 <i>Melanocorypha maxima</i> , Longbilled Calandra Lark (894) |
| 6 <i>Eremopterix nigriceps</i> , Blackcrowned Finch-Lark (879) | 17 <i>Eremophila alpestris</i> , Horned Lark (897) |
| 7 <i>Ammomanes deserti</i> , Desert Finch-Lark (880) | 18 <i>Eremophila a. albigula</i> (895), ssp of 897 |
| 8 <i>Alaemon alaudipes</i> , Bifasciated, or Large Desert, Lark (884) | 19 <i>Galerida deva</i> , Sykes's Crested Lark (902) |
| 9 <i>Ammomanes phoenicurus</i> , Rufoustailed Finch-Lark (882) | 20 <i>Galerida cristata</i> , Crested Lark (899) |
| 10 <i>Ammomanes cincturus</i> , Bartailed Desert Lark (881) | 21 <i>Galerida malabarica</i> , Malabar Crested Lark (901) |
| 11 <i>Melanocorypha bimaculata</i> , Eastern Calandra Lark (892) | 22 <i>Alauda gulgula</i> , Eastern Skylark (907) |
| | 23 <i>Alauda arvensis</i> , Skylark (903) |

PLATE 65

- | | |
|--|--|
| 1 <i>Hemiprocne longipennis</i> , Crested Tree Swift (709) | 11 <i>Hirundo rustica</i> , Swallow (916) |
| 2 <i>Riparia riparia</i> , Collared Sand Martin (910) | 12 <i>Hirundo r. tytleri</i> (918), ssp of 916 |
| 3 <i>Riparia paludicola</i> , Plain Sand Martin (912) | 13 <i>Hirundo tahitica</i> , House Swallow (919) |
| 4 <i>Hirundo obsoleta</i> , Pale Crag Martin (915) | 14 <i>Hirundo daurica</i> , Striated or Redrumped Swallow (927) |
| 5 <i>Hirundo rupestris</i> , Crag Martin (913) | 15 <i>Hirundo d. hyperythra</i> (928), ssp of 927 |
| 6 <i>Hirundo concolor</i> , Dusky Crag Martin (914) | 16 <i>Artamus leucorhynchus</i> , Whitebreasted Swallow-Shrike (983) |
| 7 <i>Delichon nipalensis</i> , Nepal House Martin (932) | 17 <i>Hirundo fluvicola</i> , Indian Cliff Swallow (922) |
| 8 <i>Delichon dasypus</i> , Asian House Martin (SE) | 18 <i>Artamus fuscus</i> , Ashy Swallow-Shrike (982) |
| 9 <i>Hirundo smithii</i> , Wiretailed Swallow (921) | |
| 10 <i>Delichon urbica</i> , House Martin (931) | |

PLATE 66

- 1 *Hypothymis azurea*, Blacknaped Flycatcher (1465)
- 2 *Terpsiphone paradisi*, Paradise Flycatcher (1461)
- 3 *Rhipidura a. albogularis* (1458), ssp of 1455
- 4 *Rhipidura aureola*, Whitebrowed Fantail Flycatcher (1451)
- 5 *Rhipidura albicollis*, Whitethroated Fantail Flycatcher (1455)
- 6 *Lanius vittatus*, Baybacked Shrike (940)
- 7 *Lanius c. isabellinus* (943), ssp of 941
- 8 *Lanius c. phoenicuroides* (942), ssp of 941
- 9 *Lanius cristatus*, Brown Shrike (949)
- 10 *Lanius collurio*, Burmese Shrike (938)
- 11 *Lanius minor*, Lesser Grey Shrike (937)
- 12 *Lanius excubitor*, Grey Shrike (933)
- 13 *Lanius collurio*, Redbacked Shrike (941)
- 14 *Lanius senator*, Woodchat Shrike (951)
- 15 *Lanius tephronotus*, Greybacked or Tibetan Shrike (945)
- 16 *Bombycilla garrulus*, Waxwing (1062)
- 17 *Lanius schach*, Rufousbacked Shrike (946)
- 18 *Lanius s. tricolor* (918), ssp of 916
- 19 *Hypocolius ampelinus*, Grey Hypocolius (1063)

PLATE 67

- 1 *Dicrurus adsimilis*, Black Drongo or King-Crow (963)
- 2 *Dicrurus remifer*, Lesser Racket-tailed Drongo (972)
- 3 *Dicrurus annectans*, Crowbilled Drongo (970)
- 4 *Dicrurus paradiseus*, Greater Racket-tailed Drongo (976)
- 5 *Dicrurus p. lophorhinus* (979), ssp of 976
- 6 *Dicrurus aeneus*, Bronzed Drongo (971)
- 7 *Dicrurus hottentottus*, Haircrested or Spangled Drongo (973)

- 8 *Dicrurus leucophaeus*, Grey or Ashy Drongo (965)
- 9 *Dicrurus l. salangensis* (966a), ssp of 965
- 10 *Dicrurus andamanensis*, Andaman Drongo (975)
- 11 *Surniculus lugubris*, Drongo-Cuckoo (588)
- 12 *Dicrurus caerulescens*, Whitebellied Drongo (967)
- 13 *Cinclus cinclus*, Whitebreasted Dipper (1773)
- 14 *Cinclus pallasii*, Brown Dipper (1775)

PLATE 68

- | | |
|--|--|
| 1 <i>Aplonis panayensis</i> , Glossy Stare or Starling (986) | 11 <i>Sturnus contra</i> , Pied Myna (1002) |
| 2 <i>Saroglossa spiloptera</i> , Spottedwinged Stare (984) | 12 <i>Acridotheres tristis</i> , Common Myna (1006) |
| 3 <i>Sturnus malabaricus</i> , Greyheaded Myna (987) | 13 <i>Sturnus sinensis</i> , Chinese or Greybacked Myna (1005) |
| 4 <i>Sturnus m. blythi</i> (988), ssp of 987 | 14 <i>Acridotheres ginginianus</i> , Bank Myna (1008) |
| 5 <i>Sturnus pagodarum</i> , Blackheaded or Brahminy Myna (994) | 15 <i>Acridotheres fuscus</i> , Jungle Myna (1009) |
| 6 <i>Sturnus sturninus</i> , Daurian Myna (995) | 16 <i>Mino coronatus</i> , Goldcrested Myna (1014) |
| 7 <i>Sturnus senex</i> , Ceylon Whiteheaded Myna or Starling (993) | 17 <i>Acridotheres albocinctus</i> , Collared Myna (1013) |
| 8 <i>Sturnus erythropygius</i> , Whiteheaded Myna (991) | 18 <i>Acridotheres javanicus</i> , Orangebilled Jungle Myna (1012) |
| 9 <i>Sturnus vulgaris</i> , Starling (997) | 19 <i>Gracula religiosa</i> , Hill Myna (1015) |
| 10 <i>Sturnus roseus</i> , Rosy Pastor (996) | 20 <i>Gracula ptilogynys</i> , Ceylon Hill Myna (1019) |

PLATE 69

- 1 *Garrulus lanceolatus*, Blackthroated Jay (1022)
- 2 *Garrulus glandarius*, Redcrowned Jay (1020)
- 3 *Pica pica*, Whiterumped Magpie (1029)
- 4 *Cissa chinensis*, Green Magpie (1023)
- 5 *Cissa ornata*, Ceylon Magpie (1024)
- 6 *Cissa flavirostris*, Yellowbilled Blue Magpie (1026)
- 7 *Cissa erythrorhyncha*, Redbilled Blue Magpie (1027)
- 8 *Dendrocitta formosae*, Himalayan Tree Pie (1038)

- 9 *Dendrocitta leucogastra*, Whitebellied Tree Pie (1036)
- 10 *Dendrocitta vagabunda*, Indian Tree Pie (1032)
- 11 *Dendrocitta frontalis*, Blackbrowed Tree Pie (1035)
- 12 *Dendrocitta bayleyi*, Andaman Tree Pie (1040)
- 13 *Nucifraga caryocatactes*, Nutcracker (1042)
- 14 *Nucifraga c. hemispila* (1043), ssp of 1042
- 15 *Podoces humilis*, Hume's Ground Chough (1041)

PLATE 72

- | | |
|--|--|
| 1 <i>Aegithina tiphia</i> , Common Iora (1098) | 7 <i>Pycnonotus jocosus</i> , Redwhiskered Bulbul (1121) |
| 2 <i>Myzornis pyrrhura</i> , Firetailed Myzornis (1338) | 8 <i>Hypsipetes flavalus</i> , Browneared Bulbul (1147) |
| 3 <i>Aegithina nigrolutea</i> , Marshall's Iora (1102) | 9 <i>Pycnonotus cafer</i> , Redvented Bulbul (1128) |
| 4 <i>Chloropsis hardwickii</i> , Orangebellied Chloropsis or Leaf Bird (1106) | 10 <i>Pycnonotus c. bengalensis</i> (1131), ssp of 1128 |
| 5 <i>Chloropsis aurifrons</i> , Goldenfronted Chloropsis or Leaf Bird (1103) | 11 <i>Pycnonotus l. leucotis</i> (1123), ssp of 1125 |
| 6 <i>Chloropsis cochinchinensis</i> , Goldmantled Chloropsis or Leaf Bird (1108) | 12 <i>Pycnonotus leucogenys</i> , Whitechecked Bulbul (1125) |
| | 13 <i>Hypsipetes madagascariensis</i> , Black Bulbul (1148) |
| | 14 <i>Irena puella</i> , Fairy Bluebird (1109) |

PLATE 73

- | | |
|---|---|
| 1 <i>Spizixos canifrons</i> , Finchbilled Bulbul (1111) | 9 <i>Pycnonotus flavescens</i> , Blyth's Bulbul (1137) |
| 2 <i>Pycnonotus striatus</i> , Striated Green Bulbul (1133) | 10 <i>Pycnonotus penicillatus</i> , Yelloweared Bulbul (1136) |
| 3 <i>Pycnonotus priocephalus</i> , Greyheaded Bulbul (1114) | 11 <i>Hypsipetes mclellandi</i> , Rufousbellied Bulbul (1146) |
| 4 <i>Pycnonotus m. fulviventris</i> (1115), ssp of 1117 | 12 <i>Hypsipetes viridescens</i> , Olive Bulbul (1141) |
| 5 <i>Pycnonotus m. gularis</i> (1116), ssp of 1117 | 13 <i>Pycnonotus luteolus</i> , Whitebrowed Bulbul (1138) |
| 6 <i>Pycnonotus melanicterus</i> , Blackheaded Yellow Bulbul (1117) | 14 <i>Hypsipetes nicobariensis</i> , Nicobar Bulbul (1142) |
| 7 <i>Pycnonotus atriceps</i> , Blackheaded Bulbul (1112) | 15 <i>Hypsipetes indicus</i> , Yellowbrowed Bulbul (1144) |
| 8 <i>Pycnonotus xantholaemus</i> , Yellowthroated Bulbul (1135) | 16 <i>Cringer flaveolus</i> , Whitethroated Bulbul (1140) |

PLATE 74

- 1 *Stachyris rufifrons*, Redfronted Babbler (1209)
- 2 *Stachyris pyrrhops*, Redbilled Babbler (1211)
- 3 *Stachyris chrysaea*, Goldheaded Babbler (1212)
- 4 *Macronous gularis*, Yellowbreasted Babbler (1228)
- 5 *Stachyris ruficeps*, Redheaded Babbler (1210)
- 6 *Dumetia hyperythra*, Rufousbellied Babbler (1222)
- 7 *Dumetia h. abuensis* (1219), ssp of 1222
- 8 *Stachyris oglei*, Austen's Spotted Babbler (1218)
- 9 *Stachyris nigriceps*, Blackthroated Babbler (1214)
- 10 *Rhopocichla atriceps*, Blackheaded Babbler (1224)
- 11 *Rhopocichla a. siccatus* (1226), ssp of 1224
- 12 *Pomatorhinus f. formosus* (1187), ssp of 1186
- 13 *Pomatorhinus ferruginosus*, Coralbilled Scimitar Babbler (1186)
- 14 *Xiphirhynchus superciliaris*, Slenderbilled Scimitar Babbler (1191)
- 15 *Pomatorhinus hypoleucos*, Large Scimitar Babbler (1185)
- 16 *Pomatorhinus ruficollis*, Rufousnecked Scimitar Babbler (1178)
- 17 *Pomatorhinus ochraceiceps*, Longbilled Scimitar Babbler (1189)
- 18 *Pomatorhinus h. schisticeps* (1169), ssp of 1173
- 19 *Pomatorhinus horsfieldi*, Slatyheaded Scimitar Babbler (1173)
- 20 *Pomatorhinus erythrogeus*, Rustycheeked Scimitar Babbler (1181)
- 21 *Pomatorhinus erythrocnemis*, Spotbreasted Scimitar Babbler (SE)

PLATE 75

- | | |
|---|---|
| 1 <i>Troglodytes troglodytes</i> , Wren (1770) | 11 <i>Napothera epilepidota</i> , Small Wren-Babbler (1195) |
| 2 <i>Troglodytes t. nipalensis</i> (1771), ssp of 1770 | 12 <i>Napothera brevicaudata</i> , Streaked, or Short-tailed, Wren-Babbler (1194) |
| 3 <i>Pnoepyga pusilla</i> , Brown, or Lesser Scalybreasted, Wren-Babbler (1199) | 13 <i>Spelaeornis longicaudatus</i> , Longtailed Wren-Babbler (1202) |
| 4 <i>Spelaeornis caudatus</i> , Tailed Wren-Babbler (1200) | 14 <i>Sphenocichla humei</i> , Wedgebilled Wren (1207) |
| 5 <i>Pnoepyga albirostris</i> , Scalybreasted Wren-Babbler (1198) | 15 <i>Pellorneum albiventre</i> , Brown Babbler (1164) |
| 6 <i>Spelaeornis formosus</i> , Spotted Wren-Babbler (1206) | 16 <i>Pellorneum fuscicapillum</i> , Brown-capped Babbler (1161) |
| 7 <i>Spelaeornis chocolatinus</i> , Streaked Longtailed Wren-Babbler (1203) | 17 <i>Trichastoma tickelli</i> , Tickell's Babbler (1166) |
| 8 <i>Spelaeornis badeigularis</i> , Mishmi Wren (1201) | 18 <i>Trichastoma abbotti</i> , Abbott's Babbler (1167) |
| 9 <i>Rimator malacoptilus</i> , Longbilled Wren-Babbler (1193) | 19 <i>Pellorneum palustre</i> , Marsh Spotted Babbler (1160) |
| 10 <i>Spelaeornis troglodytoides</i> , Longtailed Spotted Wren-Babbler (1205) | 20 <i>Pellorneum ruficeps</i> , Spotted Babbler (1154) |

John V. Dick

PLATE 76

- | | |
|--|--|
| 1 <i>Garrulax subunicolor</i> , Plaincoloured Laughing Thrush (1320) | 9 <i>Garrulax rufogularis</i> , Rufouschinned Laughing Thrush (1294) |
| 2 <i>Garrulax lineatus</i> , Streaked Laughing Thrush (1314) | 10 <i>Garrulax striatus</i> , Striated Laughing Thrush (1279) |
| 3 <i>Garrulax e. nigrimentum</i> (1326), ssp of 1324 | 11 <i>Garrulax moniligerus</i> , Necklaced Laughing Thrush (1275) |
| 4 <i>Garrulax erythrocephalus</i> , Redheaded Laughing Thrush (1324) | 12 <i>Babax lanceolatus</i> , Chinese Babax (1270) |
| 5 <i>Garrulax squamatus</i> , Bluewinged Laughing Thrush (1319) | 13 <i>Garrulax pectoralis</i> , Blackgorgeted Laughing Thrush (1277) |
| 6 <i>Garrulax austeni</i> , Browncapped Laughing Thrush (1318) | 14 <i>Babax waddelli</i> , Giant Tibetan Babax (1271) |
| 7 <i>Garrulax virgatus</i> , Manipur Streaked Laughing Thrush (1317) | 15 <i>Garrulax o. maximus</i> (1297), ssp of 1299 |
| 8 <i>Garrulax merulinus</i> , Spottedbreasted Laughing Thrush (1304) | 16 <i>Garrulax ocellatus</i> , Whitespotted Laughing Thrush (1299) |

John H. Dick

PLATE 77

- 1 *Garrulax phoeniceus*, Crimsonwinged Laughing Thrush (1331)
- 2 *Garrulax cachinnans*, Nilgiri Laughing Thrush (1307)
- 3 *Garrulax jerdoni*, Whitebreasted Laughing Thrush (1310)
- 4 *Garrulax cineraceus*, Ashy Laughing Thrush (1291)
- 5 *Garrulax galbanus*, Yellowthroated Laughing Thrush (1286)
- 6 *Garrulax delesserti*, Yellowbreasted Laughing Thrush (1287)
- 7 *Garrulax d. gularis* (1288), ssp of 1287
- 8 *Garrulax sannio*, Whitebrowed Laughing Thrush (1306)
- 9 *Garrulax ruficollis*, Rufousnecked Laughing Thrush (1303)
- 10 *Garrulax nuchalis*, Chestnutbacked Laughing Thrush (1285)
- 11 *Garrulax henrici*, Prince Henri's Laughing Thrush (1321)
- 12 *Garrulax affinis*, Blackfaced Laughing Thrush (1322)
- 13 *Garrulax variegatus*, Variegated Laughing Thrush (1290)
- 14 *Garrulax caerulatus*, Greysided Laughing Thrush (1300)
- 15 *Garrulax albogularis*, Whitethroated Laughing Thrush (1274)
- 16 *Garrulax leucolophus*, Whitecrested Laughing Thrush (1283)

PLATE 78

- | | |
|---|--|
| 1 <i>Gampsorhynchus rufulus</i> , Whiteheaded Shrike-Babbler (1347) | 9 <i>Alcippe nipalensis</i> , Nepal Babbler (1392) |
| 2 <i>Actinodura nipalensis</i> , Hoary Barwing (1352) | 10 <i>Alcippe cinereiceps</i> , Brownheaded Tit-Babbler (1384) |
| 3 <i>Alcippe brunnea</i> , Rufousheaded Tit-Babbler (1388) | 11 <i>Alcippe poiocephala</i> , Quaker Babbler (1390) |
| 4 <i>Actinodura egertoni</i> , Spectacled Barwing (1348) | 12 <i>Yuhina xantholeuca</i> , Whitebellied Yuhina (1375) |
| 5 <i>Actinodura waldeni</i> , Austen's Barwing (1355) | 13 <i>Yuhina castaniceps</i> , Whitebrowed Yuhina (1363) |
| 6 <i>Alcippe castaneiceps</i> , Chestnut-headed Tit-Babbler (1379) | 14 <i>Alcippe vinipectus</i> , Whitebrowed Tit-Babbler (1381) |
| 7 <i>Alcippe cinerea</i> , Dusky-Green or Yellowthroated Tit-Babbler (1378) | 15 <i>Yuhina flavicollis</i> , Yellownaped Yuhina (1368) |
| 8 <i>Alcippe rufogularis</i> , Redthroated Tit-Babbler (1386) | 16 <i>Yuhina nigrimenta</i> , Blackchinned Yuhina (1374) |
| | 17 <i>Yuhina occipitalis</i> , Rufousvented Yuhina (1373) |
| | 18 <i>Yuhina gularis</i> , Stripethroated Yuhina (1372) |
| | 19 <i>Yuhina bakeri</i> , Whitenaped Yuhina (1366) |

PLATE 79

- 1 *Timalia pileata*, Redcapped Babbler (1229)
- 2 *Chrysomma sinense*, Yelloweyed Babbler (1231)
- 3 *Chrysomma altirostre*, Jerdon's Babbler (1233)
- 4 *Turdoides caudatus*, Common Babbler (1254)
- 5 *Turdoides earlei*, Striated Babbler (1256)
- 6 *Turdoides nipalensis*, Spiny Babbler (1269)
- 7 *Turdoides striatus*, Jungle Babbler (1265)
- 8 *Turdoides malcolmi*, Large Grey Babbler (1258)
- 9 *Turdoides affinis*, Whiteheaded Babbler (1267)

- 10 *Turdoides longirostris*, Slenderbilled Babbler (1257)
- 11 *Turdoides rufescens*, Ceylon Rufous Babbler (1266)
- 12 *Turdoides subrufus*, Rufous Babbler (1259)
- 13 *Paradoxornis unicolor*, Brown Suthora or Parrotbill (1237)
- 14 *Garrulax cinereifrons*, Ashyheaded Laughing Thrush (1272)
- 15 *Conostoma aemodium*, Great Parrotbill (1236)

PLATE 80

- | | |
|---|---|
| 1 <i>Leiothrix argentauris</i> , Silvereared Mesia (1333) | 8 <i>Pteruthius flaviscapis</i> , Redwinged Shrike-Babbler (1341) |
| 2 <i>Leiothrix lutea</i> , Redbilled Leiothrix (1336) | 9 <i>Minla strigula</i> , Barthroated Siva (1359) |
| 3 <i>Cutia nipalensis</i> , Nepal Cutia (1339) | 10 <i>Minla cyanouroptera</i> , Bluewinged Siva (1362) |
| 4 <i>Pteruthius rufiventer</i> , Rufousbellied Shrike-Babbler (1340) | 11 <i>Alcippe chrysotis</i> , Goldenbreasted Tit-Babbler (1376) |
| 5 <i>Pteruthius xanthochlorus</i> , Green Shrike-Babbler (1343) | 12 <i>Minla ignotincta</i> , Redtailed Minla (1357) |
| 6 <i>Pteruthius aenobarbus</i> , Chestnutfronted Shrike-Babbler (1346) | 13 <i>Heterophasia capistrata</i> , Blackcapped Sibia (1396) |
| 7 <i>Pteruthius melanotis</i> , Chestnut-throated Shrike-Babbler (1345) | 14 <i>Heterophasia annectens</i> , Chestnutbacked Sibia (1395) |
| | 15 <i>Heterophasia pulchella</i> , Beautiful Sibia (1400) |
| | 16 <i>Heterophasia picaoides</i> , Longtailed Sibia (1401) |
| | 17 <i>Heterophasia gracilis</i> , Grey Sibia (1399) |

PLATE 81

- | | |
|--|--|
| 1 <i>Pachycephala grisola</i> , Grey Thickhead or Mangrove Whistler (1470) | 12 <i>Muscicapa strophliata</i> , Orangegorgeted Flycatcher (1414) |
| 2 <i>Muscicapa parva</i> , Redbreasted Flycatcher (1411) | 13 <i>Rhinomyias brunneata</i> , Olive Flycatcher (1402) |
| 3 <i>Muscicapa p. albicilla</i> (1412), ssp of 1411 | 14 <i>Muscicapa westermanni</i> , Little Pied Flycatcher (1419) |
| 4 <i>Muscicapa subrubra</i> , Kashmir Redbreasted Flycatcher (1413) | 15 <i>Muscicapa superciliaris</i> , Whitebrowed Blue Flycatcher (1421) |
| 5 <i>Muscicapa striata</i> , Spotted Flycatcher (1403) | 16 <i>Muscicapa macgrigoriae</i> , Small Niltava (1429) |
| 6 <i>Muscicapa muttui</i> , Brownbreasted Flycatcher (1408) | 17 <i>Muscicapa l. minuta</i> (1424), ssp of 1423 |
| 7 <i>Muscicapa sibirica</i> , Sooty Flycatcher (1406) | 18 <i>Muscicapa leucomelanura</i> , Slaty Blue Flycatcher (1423) |
| 8 <i>Muscicapa ruficauda</i> , Rufoustailed Flycatcher (1409) | 19 <i>Muscicapa grandis</i> , Large Niltava (1428) |
| 9 <i>Muscicapa ferruginea</i> , Ferruginous Flycatcher (1410) | 20 <i>Muscicapa m. leucops</i> (1416), ssp of 1415 |
| 10 <i>Muscicapa nigrorufa</i> , Black-and-Orange Flycatcher (1427) | 21 <i>Muscicapa monileger</i> , Whitegorgeted Flycatcher (1415) |
| 11 <i>Muscicapa latirostris</i> , Brown Flycatcher (1407) | |

PLATE 82

- | | |
|---|---|
| 1 <i>Muscicapa tickelliae</i> , Tickell's Blue Flycatcher (1442) | 8 <i>Muscicapa poliogenys</i> , Brooks's Flycatcher (1436) |
| 2 <i>Muscicapa sapphira</i> , Sapphireheaded Flycatcher (1426) | 9 <i>Muscicapa pallipes</i> , Whitebelly Blue Flycatcher (1435) |
| 3 <i>Muscicapella hodgsoni</i> , Pigmy Blue Flycatcher (1447) | 10 <i>Muscicapa thalassina</i> , Verditer Flycatcher (1445) |
| 4 <i>Muscicapa hodgsonii</i> , Rustybreasted Blue Flycatcher (1418) | 11 <i>Muscicapa unicolor</i> , Pale Blue Flycatcher (1439) |
| 5 <i>Muscicapa hyperythra</i> , Rufousbreasted Blue Flycatcher (1417) | 12 <i>Muscicapa sordida</i> , Dusky Blue Flycatcher (1444) |
| 6 <i>Muscicapa rubeculoides</i> , Bluethroated Flycatcher (1440) | 13 <i>Muscicapa albicaudata</i> , Nilgiri Flycatcher (1446) |
| 7 <i>Muscicapa banyumas</i> , Largebilled Blue Flycatcher (1441) | 14 <i>Muscicapa sundara</i> , Rufousbelly Niltava (1432) |
| | 15 <i>Muscicapa concreta</i> , Whitetailed Blue Flycatcher (1434) |
| | 16 <i>Muscicapa vivida</i> , Rufousbelly Blue Flycatcher (1433) |

John X. Dick

PLATE 83

- | | |
|--|--|
| 1 <i>Cettia pallidipes</i> , Palefooted Bush Warbler (1474) | 12 <i>Acrocephalus bistrigiceps</i> , Blackbrowed Reed Warbler (1555) |
| 2 <i>Cettia diphone</i> , Chinese Bush Warbler (1476) | 13 <i>Bradypterus major</i> , Largebilled Bush Warbler (1491) |
| 3 <i>Cettia montana</i> , Strongfooted Bush Warbler (1478) | 14 <i>Acrocephalus aedon</i> , Thickbilled Warbler (1549) |
| 4 <i>Cettia flavolivacea</i> , Aberrant Bush Warbler (1481) | 15 <i>Bradypterus tacsanowskii</i> , Central Asian Bush Warbler (1492) |
| 5 <i>Cettia brunnifrons</i> , Rufouscapped Bush Warbler (1486) | 16 <i>Acrocephalus dumetorum</i> , Blyth's Reed Warbler (1556) |
| 6 <i>Cettia major</i> , Large Bush Warbler (1479) | 17 <i>Acrocephalus agricola</i> , Paddyfield Warbler (1557) |
| 7 <i>Cettia acanthizoides</i> , Verreaux's Bush Warbler (1484) | 18 <i>Acrocephalus scirpaceus</i> , Reed Warbler (1555a) |
| 8 <i>Bradypterus luteoventris</i> , Brown Bush Warbler (1493) | 19 <i>Acrocephalus stentoreus</i> , Indian Great Reed Warbler (1550) |
| 9 <i>Bradypterus palliseri</i> , Palliser's Warbler (1494) | |
| 10 <i>Bradypterus thoracicus</i> , Spotted Bush Warbler (1490) | |
| 11 <i>Cettia cetti</i> , Cetti's Warbler (1488) | |

PLATE 84

- | | |
|---|---|
| 1 <i>Sylvia nisoria</i> , Barred Warbler (1564a) | 10 <i>Regulus regulus</i> , Goldcrest (1629) |
| 2 <i>Sylvia communis</i> , Whitethroat (1566) | 11 <i>Sylvia mystacea</i> , Menetries's Warbler (1571a) |
| 3 <i>Sylvia hortensis</i> , Orphean Warbler (1565) | 12 <i>Leptopoeile elegans</i> , Crested Tit-Warbler (1632) |
| 4 <i>Sylvia curruca minula</i> , Lesser Whitethroat (1569) | 13 <i>Prinia socialis</i> , Ashy Wren-Warbler (1517) |
| 5 <i>Sylvia curruca althaea</i> , Lesser Whitethroat (1570) | 14 <i>Prinia s. stewarti</i> (1515), ssp of 1517 |
| 6 <i>Sylvia curruca blythi</i> , Lesser Whitethroat (1567) | 15 <i>Prinia cinereocapilla</i> , Hodgson's Wren-Warbler (1507) |
| 7 <i>Sylvia nana</i> , Desert Warbler (1571) | 16 <i>Prinia rufescens</i> , Rufous Wren-Warbler (1501) |
| 8 <i>Leptopoeile sophiae</i> , Stoliczka's Tit-Warbler (1633) | 17 <i>Prinia hodgsonii</i> , Franklin's Wren-Warbler (1503) |
| 9 <i>Leptopoeile s. obscura</i> (1634), ssp of 1633 | |

PLATE 85

- 1 *Locustella certhiola*, Pallas's Grasshopper Warbler (1543)
- 2 *Schoenicola platyura*, Broadtailed Grass Warbler (1546)
- 3 *Locustella naevia*, Grasshopper Warbler (1545)
- 4 *Locustella n. obscurior* (RE), ssp of 1545
- 5 *Megalurus plaustris*, Striated Marsh Warbler (1548)
- 6 *Chaetornis striatus*, Bristled Grass Warbler (1547)
- 7 *Prinia gracilis*, Streaked Wren-Warbler (1508)
- 8 *Prinia buchanani*, Rufousfronted Wren-Warbler (1506)
- 9 *Locustella lanceolata*, Streaked Grasshopper Warbler (1544)
- 10 *Acrocephalus melanopogon*, Moustached Sedge Warbler (1495)
- 11 *Prinia atrogularis*, Blackthroated Hill Warbler (1529)
- 12 *Prinia subflava*, Plain Wren-Warbler (1511)
- 13 *Prinia sylvatica*, Jungle Wren-Warbler (1521)
- 14 *Prinia s. sindiana* (1524), ssp of 1521
- 15 *Prinia flaviventris*, Yellowbellied Wren-Warbler (1525)
- 16 *Prinia b. cinerascens* (1532), ssp of 1531
- 17 *Prinia burnesii*, Longtailed Grass Warbler (1531)
- 18 *Scotocerca inquieta*, Streaked Scrub Warbler (1533)
- 19 *Prinia criniger*, Brown Hill Warbler (1527)
- 20 *Cisticola juncidis*, Streaked Fantail Warbler (1498)
- 21 *Graminicola bengalensis*, Large Grass Warbler (1534)
- 22 *Cisticola exilis*, Fantail Warbler (1497)

PLATE 86

- | | |
|--|--|
| 1 <i>Hippolais languida</i> , Upcher's Warbler (1564) | 13 <i>Phylloscopus schwarzi</i> , Radde's Leaf Warbler (SE) |
| 2 <i>Phylloscopus neglectus</i> , Plain Leaf Warbler (1577) | 14 <i>Phylloscopus pulcher</i> , Orangebarred Leaf Warbler (1588) |
| 3 <i>Hippolais caligata</i> , Booted Warbler (1562) | 15 <i>Phylloscopus proregulus</i> , Pallas's Leaf Warbler (1594) |
| 4 <i>Phylloscopus collybita</i> , Brown Leaf Warbler or Chiffchaff (1574) | 16 <i>Phylloscopus maculipennis</i> , Greysaced Leaf Warbler (1599) |
| 5 <i>Phylloscopus tytleri</i> , Tytler's Leaf Warbler (1578) | 17 <i>Phylloscopus cantator</i> , Blackbrowed Leaf Warbler (1612) |
| 6 <i>Phylloscopus affinis</i> , Tickell's Leaf Warbler (1579) | 18 <i>Phylloscopus occipitalis</i> , Large Crowned Leaf Warbler (1606) |
| 7 <i>Phylloscopus a. arcanus</i> (1580), ssp of 1579 | 19 <i>Phylloscopus o. coronatus</i> (1607), ssp of 1606 |
| 8 <i>Phylloscopus griseolus</i> , Olivaceous Leaf Warbler (1581) | 20 <i>Phylloscopus reguloides</i> , Blyth's Leaf Warbler (1609) |
| 9 <i>Phylloscopus subviridis</i> , Brooks's Leaf Warbler (1593) | 21 <i>Phylloscopus trochiloides</i> , Dull Green Leaf Warbler (1605) |
| 10 <i>Phylloscopus inornatus</i> , Plain, or Yellowbrowed, Leaf Warbler (1592) | 22 <i>Phylloscopus magnirostris</i> , Largebilled Leaf Warbler (1601) |
| 11 <i>Phylloscopus fuscatus</i> , Dusky Leaf Warbler (1586) | |
| 12 <i>Phylloscopus fuliginenter</i> , Smoky Willow Warbler (1582) | |

PLATE 87

- | | |
|---|--|
| 1 <i>Rhipidura hypoxantha</i> , Yellowbellied Fantail Flycatcher (1450) | 10 <i>Abroscopus hodgsoni</i> , Broadbilled Flycatcher-Warbler (1627) |
| 2 <i>Seicercus burkii</i> , Blackbrowed Flycatcher-Warbler (1615) | 11 <i>Orthotomus sutorius</i> , Tailor Bird (1535) |
| 3 <i>Abroscopus albogularis</i> , Whitethroated Flycatcher-Warbler (1626) | 12 <i>Orthotomus cucullatus</i> , Goldenheaded Tailor Bird (1541) |
| 4 <i>Abroscopus schisticeps</i> , Blackfaced Flycatcher-Warbler (1624) | 13 <i>Seicercus castaneiceps</i> , Chestnut-headed Flycatcher-Warbler (1621) |
| 5 <i>Seicercus affinis</i> , Allied Flycatcher-Warbler (1613) | 14 <i>Orthotomus atrogularis</i> , Blacknecked Tailor Bird (1540) |
| 6 <i>Abroscopus superciliaris</i> , Yellowbellied Flycatcher-Warbler (1622) | 15 <i>Tesia cyaniventer</i> , Dull Slatybellied Ground Warbler (1471) |
| 7 <i>Seicercus xanthoschistos</i> , Greyheaded Flycatcher-Warbler (1617) | 16 <i>Tesia olivea</i> , Slatybellied Ground Warbler (1472) |
| 8 <i>Culicicapa ceylonensis</i> , Greyheaded Flycatcher (1448) | 17 <i>Tesia castaneocoronata</i> , Chestnut-headed Ground Warbler (1473) |
| 9 <i>Seicercus poliopteryx</i> , Greycheeked Flycatcher-Warbler (1620) | |

PLATE 88

- | | |
|---|---|
| 1 <i>Brachypteryx stellata</i> , Gould's Shortwing (1635) | 10 <i>Erithacus pectardens</i> , Firethroat (1652) |
| 2 <i>Brachypteryx hyperythra</i> , Rustybelled Shortwing (1636) | 11 <i>Erithacus brunneus</i> , Blue Chat (1650) |
| 3 <i>Brachypteryx leucophrys</i> , Lesser Shortwing (1639) | 12 <i>Erithacus cyane</i> , Siberian Blue Chat (1653) |
| 4 <i>Brachypteryx major</i> , Rufousbelly Shortwing (1637) | 13 <i>Erithacus indicus</i> , Whitebrowed Bush Robin (1659) |
| 5 <i>Brachypteryx montana</i> , Whitebrowed Shortwing (1640) | 14 <i>Erithacus cyanurus</i> , Orangeflanked Bush Robin (1655) |
| 6 <i>Erithacus megarhynchos</i> , Nightingale (1642) | 15 <i>Erithacus chrysaeus</i> , Golden Bush Robin (1658) |
| 7 <i>Erithacus calliope</i> , Rubythroat (1643) | 16 <i>Irania gutturalis</i> , Whitethroated Robin (SE) |
| 8 <i>Erithacus pectoralis</i> , Himalayan Rubythroat (1647) | 17 <i>Erithacus hyperythrus</i> , Rufousbelly Bush Robin (1660) |
| 9 <i>Erithacus svecicus</i> , Bluethroat (1644) | |

PLATE 89

- | | |
|--|---|
| 1 <i>Erythropygia galactotes</i> , Rufous Chat (1641) | 11 <i>Phoenicurus aureus</i> , Daurian Redstart (1677) |
| 2 <i>Phoenicurus erythronotus</i> , Eversmann's Redstart (1669) | 12 <i>Rhyacornis fuliginosus</i> , Plumbeous Redstart (1679) |
| 3 <i>Phoenicurus ochruros rufiventris</i> , Black Redstart (1672) | 13 <i>Hodgsonius phoenicuroides</i> , Hodgson's Shortwing (1680) |
| 4 <i>Phoenicurus ochruros phoenicuroides</i> , Black Redstart (1671) | 14 <i>Cinclidium leucurum</i> , Whitetailed Blue Robin (1681) |
| 5 <i>Phoenicurus caeruleocephalus</i> , Blueheaded Redstart (1670) | 15 <i>Cinclidium frontale</i> , Bluefronted Robin (1682) |
| 6 <i>Phoenicurus phoenicurus</i> , Redstart (1673) | 16 * <i>Saxicoloides fulicata</i> , Indian Robin (1720) |
| 7 <i>Phoenicurus hodgsoni</i> , Hodgson's Redstart (1674) | 17 * <i>Saxicoloides f. cambaiensis</i> , (1717). ssp of 1720 |
| 8 <i>Phoenicurus frontalis</i> , Bluefronted Redstart (1675) | 18 <i>Cercomela fusca</i> , Brown Rock Chat (1692) |
| 9 <i>Phoenicurus schisticeps</i> , Whitethroated Redstart (1676) | 19 <i>Chaimarrornis leucocephalus</i> , Whitecapped Redstart or River Chat (1716) |
| 0 <i>Phoenicurus erythrogaster</i> , Guldenstadt's Redstart (1678) | |

* Illustrations Nos. 16 and 17 are incorrect. In both cases the blue colour shown should be jet black with a bluish sheen. Also, the chestnut on the underparts should be restricted to the vent and under tail-coverts.

PLATE 90

- | | |
|---|--|
| 1 <i>Copsychus malabaricus</i> , Shama (1665) | 9 <i>Enicurus leschenaulti</i> , Leschenault's Forktail (1687) |
| 2 <i>Copsychus m. albiventris</i> (1668), ssp of 1665 | 10 <i>Cochoa viridis</i> , Green Cochoa (1691) |
| 3 <i>Grandala coelicolor</i> , Hodgson's Grandala (1683) | 11 <i>Cochoa purpurea</i> , Purple Cochoa (1690) |
| 4 <i>Copsychus saularis</i> , Magpie-Robin (1661) | 12 <i>Myiophonus blighi</i> , Ceylon Whistling Thrush (1727) |
| 5 <i>Enicurus scouleri</i> , Little Forktail (1684) | 13 <i>Myiophonus horsfieldii</i> , Malabar Whistling Thrush (1728) |
| 6 <i>Enicurus schistaceus</i> , Slatybacked Forktail (1686) | 14 <i>Myiophonus caeruleus</i> , Blue Whistling Thrush (1729) |
| 7 <i>Enicurus immaculatus</i> , Blackbacked Forktail (1685) | |
| 8 <i>Enicurus maculatus</i> , Spotted Forktail (1688) | |

PLATE 91

- 1 *Saxicola macrorhyncha*, Stoliczka's Bush Chat (1693)
- 2 *Saxicola torquata*, Stone Chat or Collared Bush Chat (1697)
- 3 *Saxicola t. przewalskii* (1696), ssp of 1697
- 4 *Saxicola insignis*, Hodgson's Bush Chat (1694)
- 5 *Saxicola caprata*, Pied Bush Chat (1701)
- 6 *Saxicola jerdoni*, Jerdon's Bush Chat (1704)
- 7 *Saxicola leucura*, Whitetailed Stone Chat (1699)
- 8 *Saxicola ferrea*, Dark-Grey Bush Chat (1705)
- 9 *Oenanthe oenanthe*, Wheatear (1708)

- 10 *Oenanthe isabellina*, Isabelline Chat (1706)
- 11 *Oenanthe xanthopyrma*, Redtailed Chat (1707)
- 12 *Oenanthe deserti*, Desert Wheatear (1710)
- 13 *Oenanthe pleschanka*, Pleschanka's Pied Chat or Wheatear (1715)
- 14 *Oenanthe alboniger*, Hume's Chat (1714)
- 15 *Oenanthe finschi*, Barnes's Chat (1711)
- 16 *Oenanthe monacha*, Hooded Chat (1713)
- 17 *Oenanthe picata*, Pied Chat (1712)

PLATE 92

- | | |
|--|--|
| 1 <i>Monticola rufiventris</i> , Chestnutbelled Rock Thrush (1724) | 8 <i>Turdus boulboul</i> , Greywinged Blackbird (1750) |
| 2 <i>Zoothera citrina</i> , Orangeheaded Ground Thrush (1733) | 9 <i>Turdus albocinctus</i> , Whitecollared Blackbird (1749) |
| 3 <i>Zoothera c. cyanotus</i> (1734), ssp of 1733 | 10 <i>Turdus m. kinnisii</i> (1757), ssp of 1752 |
| 4 <i>Monticola solitarius</i> , Blue Rock Thrush (1726) | 11 <i>Turdus m. nigropileus</i> (1753), ssp of 1752 |
| 5 <i>Monticola cinclorhynchus</i> , Blueheaded Rock Thrush (1723) | 12 <i>Turdus m. simillimus</i> (1755), ssp of 1752 |
| 6 <i>Turdus unicolor</i> , Tickell's Thrush (1748) | 13 <i>Turdus merula</i> , Blackbird (1752) |
| 7 <i>Monticola saxatilis</i> , Rock Thrush (1722). | 14 <i>Turdus feai</i> , Fea's Thrush (1761) |
| | 15 <i>Turdus kessleri</i> , Kessler's Thrush (1760) |
| | 16 <i>Turdus rubrocanus</i> , Greyheaded Thrush (1758) |
| | 17 <i>Turdus r. gouldii</i> (1759), ssp of 1758 |

PLATE 93

- 1 *Zoothera wardii*, Pied Ground Thrush (1731)
- 2 *Zoothera spiloptera*, Spottedwinged Ground Thrush (1737)
- 3 *Zoothera sibirica*, Siberian Ground Thrush (1732)
- 4 *Zoothera mollissima*, Plainbacked Mountain Thrush (1739)
- 5 *Zoothera marginata*, Lesser Brown Thrush (1746)
- 6 *Zoothera dixonii*, Longtailed Mountain Thrush (1740)
- 7 *Zoothera monticola*, Large Brown Thrush (1745)
- 8 *Zoothera dauma*, Golden, or Smallbilled, Mountain Thrush (1741)

- 9 *Turdus naumanni*, Dusky Thrush (1765)
- 10 *Turdus dissimilis*, Blackbreasted Thrush (1747)
- 11 *Turdus obscurus*, Dark Thrush (1762)
- 12 *Turdus ruficollis*, Redthroated Thrush (1764)
- 13 *Turdus r. atrogularis*, Blackthroated Thrush (1763), ssp of 1764
- 14 *Turdus iliacus*, Redwing (1767)
- 15 *Turdus pilaris*, Fieldfare (1766)
- 16 *Turdus viscivorus*, Mistle Thrush (1768)

PLATE 94

- | | |
|---|--|
| 1 <i>Prunella collaris</i> , Alpine Accentor (1779) | 12 <i>Montifringilla adamsi</i> , Tibet Snow Finch (1952) |
| 2 <i>Prunella strophiata</i> , Rufousbreasted Accentor (1783) | 13 <i>Montifringilla nivalis</i> , Snow Finch (1951) |
| 3 <i>Prunella rubeculoides</i> , Robin Accentor (1781) | 14 <i>Montifringilla taczanowskii</i> , Mandelli's Snow Finch (1953) |
| 4 <i>Prunella immaculata</i> , Maroonbacked Accentor (1788) | 15 <i>Leucosticte nemoricola</i> , Hodgson's Mountain Finch (2000) |
| 5 <i>Prunella himalayana</i> , Altai Accentor (1780) | 16 <i>Montifringilla ruficollis</i> , Rednecked Snow Finch (1954) |
| 6 <i>Prunella atrogularis</i> , Blackthroated Accentor (1787) | 17 <i>Leucosticte brandti</i> , Brandt's Mountain Finch (2003) |
| 7 <i>Prunella f. ocularis</i> (1785a), ssp of 1784 | 18 <i>Montifringilla theresae</i> , Bartailed Snow Finch (SE) |
| 8 <i>Prunella montanella</i> , Siberian Accentor (1787a) | |
| 9 <i>Prunella fulvescens</i> , Brown Accentor (1784) | |
| 10 <i>Montifringilla blanfordi</i> , Blandford's Snow Finch (1955) | |
| 11 <i>Montifringilla davidiana</i> , Pere David's Snow Finch (1956) | |

PLATE 95

- | | |
|--|--|
| 1 <i>Aegithalos leucogenys</i> , Whitecheeked Tit (1821) | 14 <i>Parus spilonotus</i> , Blackspotted Yellow Tit (1812) |
| 2 <i>Aegithalos niveogularis</i> , Whitethroated Tit (1822) | 15 <i>Parus cyanus flavipectus</i> , Yellowbreasted Blue Tit or Azure Tit (1800) |
| 3 <i>Aegithalos iouschistos</i> , Rufousfronted Tit (1823) | 16 <i>Parus cyanus tianschanicus</i> (Tien Shan) |
| 4 <i>Aegithalos cocinnus</i> , Redheaded Tit (1818) | Yellowbreasted Blue Tit (1800a) |
| 5 <i>Aegithalos c. manipurensis</i> (1820), ssp of 1818 | 17 <i>Parus monticolus</i> , Greenbacked Tit (1799) |
| 6 <i>Cephalopyrus flammiceps</i> , Firecapped Tit (1815) | 18 <i>Parus major</i> , Grey Tit (1794) |
| 7 <i>Remiz pendulinus</i> , Penduline Tit (1817) | 19 <i>Parus nuchalis</i> , Whitewinged Black Tit (1798) |
| 8 <i>Remiz p. nigricans</i> (RE), ssp of 1817 | 20 <i>Melanochlora sultanea</i> , Sultan Tit (1789) |
| 9 <i>Parus dichrous</i> , Brown Crested Tit (1808) | 21 <i>Sylviparus modestus</i> , Yellowbrowed Tit (1814) |
| 10 <i>Parus ater</i> , Coal Tit (1803) | 22 <i>Parus xanthogenys</i> , Yellowcheeked Tit (1811) |
| 11 <i>Parus rufonuchalis</i> , Black Tit (1804) | 23 <i>Parus bokharensis</i> , Blue-Grey Tit (SE) |
| 12 <i>Parus melanolophus</i> , Crested Black Tit (1802) | |
| 13 <i>Parus rubidiventris</i> , Rufousbellied Crested Tit (1805) | |

PLATE 96

- 1 *Sitta europea nagaensis*, European Nuthatch (1826)
- 2 *Sitta himalayensis*, Whitetailed Nuthatch (1834)
- 3 *Sitta castanea*, Chestnutbelled Nuthatch (1830)
- 4 *Sitta europea cashmirensis*, European Nuthatch (1824)
- 5 *Sitta tephronota*, Rock Nuthatch (1836)
- 6 *Sitta leucopsis*, Whitechecked Nuthatch (1832)
- 7 *Sitta frontalis*, Velvetfronted Nuthatch (1838)
- 8 *Sitta formosa*, Beautiful Nuthatch (1837)
- 9 *Tichodroma muraria*, Wall Creeper (1839)
- 10 *Certhia familiaris*, Tree Creeper (1843)
- 11 *Certhia himalayana*, Himalayan Tree Creeper (1847)
- 12 *Certhia nipalensis*, Nepal Tree Creeper (1851)
- 13 *Certhia discolor*, Sikkim Tree Creeper (1849)
- 14 *Salpornis spilonotos*, Spotted Grey Creeper (1841)
- 15 *Panurus biarmicus*, Bearded Tit-Babbler or Reedling (1235)
- 16 *Paradoxornis gularis*, Greyheaded Parrotbill (1249)
- 17 *Paradoxornis flavirostris*, Blackthroated Parrotbill (1251)
- 18 *Paradoxornis guttaticollis*, Whitethroated Parrotbill (1252)
- 19 *Paradoxornis ruficeps*, Greater Redheaded Parrotbill (1247)
- 20 *Paradoxornis a. oatesi* (1245), ssp of 1246
- 21 *Paradoxornis atrosuperciliaris*, Lesser Redheaded Suthora or Parrotbill (1246)
- 22 *Paradoxornis nipalensis humii*, Orange Suthora (1241)
- 23 *Paradoxornis nipalensis poliotis*, Orange Suthora (1242)
- 24 *Paradoxornis fulvifrons*, Fulvousfronted Suthora or Parrotbill (1238)

PLATE 97

- 1 *Anthus n. richardi* (1857), ssp of 1859
- 2 *Anthus novaeseelandiae*, Paddyfield Pipit (1859)
- 3 *Anthus campestris*, Tawny Pipit (1861)
- 4 *Anthus similis*, Brown Rock Pipit (1868)
- 5 *Anthus pratensis*, Meadow Pipit (1856)
- 6 *Anthus cervinus*, Redthroated Pipit (1864)
- 7 *Anthus roseatus*, Vinaceousbreasted Pipit (1865)
- 8 *Anthus hodgsoni*, Indian Tree Pipit (1852)
- 9 *Anthus trivialis*, Tree Pipit (1854)
- 10 *Anthus spinoletta*, Water Pipit or Alpine Pipit (1871)
- 11 *Anthus nilghiriensis*, Nilgiri Pipit (1870)
- 12 *Anthus sylvanus*, Upland Pipit (1873)
- 13 *Motacilla alba personata*, Pied or White Wagtail (1886)
- 14 *Motacilla alba dukhunensis*, Pied or White Wagtail (1885)
- 15 *Motacilla indica*, Forest Wagtail (1874)
- 16 *Motacilla flava*, Yellow Wagtail (1880)
- 17 *Motacilla f. melanogrisea* (1878), ssp of 1880
- 18 *Motacilla maderaspatensis*, Large Pied Wagtail (1891)
- 19 *Motacilla cinerea*, Grey Wagtail (1884)
- 20 *Motacilla citreola*, Yellowheaded Wagtail (1881)

PLATE 98

- | | |
|--|--|
| 1 <i>Dicaeum agile</i> , Thickbilled Flowerpecker (1892) | 9 <i>Estrilda amandava</i> , Red Munia or Avadavat (1964) |
| 2 <i>Dicaeum melanoxanthum</i> , Yellowbellied Flowerpecker (1896) | 10 <i>Dicaeum cruentatum</i> , Scarletbacked Flowerpecker (1904) |
| 3 <i>Dicaeum erythrorhynchos</i> , Tickell's Flowerpecker (1899) | 11 <i>Lonchura m. atricapilla</i> (1977), ssp of 1978 |
| 4 <i>Dicaeum concolor</i> , Plaincoloured Flowerpecker (1902) | 12 <i>Lonchura malacca</i> , Blackheaded Munia (1978) |
| 5 <i>Dicaeum chrysorrheum</i> , Yellowvented Flowerpecker (1895) | 13 <i>Estrilda formosa</i> , Green Munia (1965) |
| 6 <i>Dicaeum vinctus</i> , Legge's Flowerpecker (1897) | 14 <i>Lonchura punctulata</i> , Spotted Munia (1974) |
| 7 <i>Dicaeum trigonostigma</i> , Orangebellied Flowerpecker (1898) | 15 <i>Lonchura k. jerdoni</i> (1971), ssp of 1973 |
| 8 <i>Dicaeum ignipectus</i> , Firebreasted Flowerpecker (1905) | 16 <i>Lonchura kelaarti</i> , Rufousbellied Munia (1973) |
| | 17 <i>Lonchura malabarica</i> , Whitethroated Munia (1966) |
| | 18 <i>Padda oryzivora</i> , Java Sparrow (1978a) |
| | 19 <i>Lonchura striata</i> , Whitebacked Munia (1968) |

PLATE 99

- 1 *Zosterops palpebrosa*, White-eye (1933)
- 2 *Zosterops ceylonensis*, Ceylon White-eye (1937)
- 3 *Anthreptes singalensis*, Rubycheek (1906)
- 4 *Nectarinia zeylonica*, Purplerumped Sunbird (1907)
- 5 *Nectarinia jugularis*, Olivebacked Sunbird (1914)
- 6 *Nectarinia sperata*, Van Hasselt's Sunbird (1910)
- 7 *Nectarinia minima*, Small Sunbird (1909)
- 8 *Aethopyga gouldiae*, Mrs Gould's Sunbird (1919)
- 9 *Nectarinia lotenia*, Loten's Sunbird (1911)

- 10 *Nectarinia asiatica*, Purple Sunbird (1917)
- 11 *Aethopyga nipalensis*, Nepal Yellowbacked Sunbird (1923)
- 12 *Aethopyga saturata*, Blackbreasted Sunbird (1925)
- 13 *Aethopyga siparaja*, Yellowbacked Sunbird (1927)
- 14 *Arachnothera longirostris*, Little Spiderhunter (1931)
- 15 *Arachnothera magna*, Streaked Spiderhunter (1932)
- 16 *Aethopyga ignicauda*, Firetailed Sunbird (1930)

PLATE 100

- 1 *Passer ammodendri*, Saxaul Sparrow (SE)
- 2 *Passer domesticus*, House Sparrow (1938)
- 3 *Passer hispaniolensis*, Spanish Sparrow (1940)
- 4 *Passer moabiticus*, Scrub Sparrow (1947a)
- 5 *Passer pyrrhonotus*, Sind Jungle Sparrow (1945)
- 6 *Passer rutilans*, Cinnamon Tree Sparrow (1916)
- 7 *Passer montanus*, Tree Sparrow (1942)
- 8 *Petronia petronia*, Rock Sparrow (1950)
- 9 *Petronia xanthocollis*, Yellowthroated Sparrow (1949)
- 10 *Ploceus benghalensis*, Blackthroated Weaver Bird (1961)
- 11 *Ploceus megarhynchus*, Finn's Baya (1960)
- 12 *Ploceus manyar*, Streaked Weaver Bird (1962)
- 13 *Ploceus philippinus*, Baya (1957)
- 14 *Ploceus p. burmanicus* (1959), ssp of 1957

PLATE 101

- | | |
|--|--|
| 1 <i>Fringilla coelebs</i> , Chaffinch (1979) | 10 <i>Carduelis carduelis</i> , Goldfinch (1989) |
| 2 <i>Fringilla montifringilla</i> , Brambling (1980) | 11 <i>Rhodospiza obsoleta</i> , Lichtenstein's Desert Finch (2008) |
| 3 <i>Serinus pusillus</i> , Goldfronted Finch (1998) | 12 <i>Callacanthus sanguinea</i> , Crimsonwinged Desert Finch (2009) |
| 4 <i>Serinus thibetanus</i> , Tibetan Siskin (1993) | 13 <i>Carpodacus githagineus</i> , Trumpeter Bullfinch (2006) |
| 5 <i>Carduelis chloris</i> , European Greenfinch (SE) | 14 <i>Carpodacus mongolicus</i> , Mongolian Trumpeter Bullfinch (2007) |
| 6 <i>Carduelis spinoides</i> , Himalayan Greenfinch (1990) | 15 <i>Carpodacus synoicus</i> , Sinai Rosefinch (SE) |
| 7 <i>Carduelis ambigua</i> , Blackheaded Greenfinch (SE) | |
| 8 <i>Acanthis cannabina</i> , Linnet (1994) | |
| 9 <i>Acanthis flavirostris</i> , Twite (1996) | |

PLATE 102

- | | |
|--|---|
| 1 <i>Carpodacus rubescens</i> , Blanford's Rosefinch (2016) | 10 <i>Carpodacus thura</i> , Whitebrowed Rosefinch (2021) |
| 2 <i>Carpodacus nipalensis</i> , Nepal Rosefinch (2015) | 11 <i>Carpodacus t. blythi</i> (2020), ssp of 2021 |
| 3 <i>Carpodacus erythrinus</i> , Common Rosefinch or Scarlet Grosbeak (2011) | 12 <i>Carpodacus rubicilloides</i> , Eastern Great Rosefinch (2028) |
| 4 <i>Carpodacus rhodochrous</i> , Pinkbrowed Rosefinch (2017) | 13 <i>Carpodacus rhodochlamys</i> , Redmantled Rosefinch (2018) |
| 5 <i>Carpodacus pulcherrimus</i> , Beautiful Rosefinch (2023) | 14 <i>Propyrrhula subhimachala</i> , Redheaded Rosefinch (2033) |
| 6 <i>Carpodacus edwardsii</i> , Large Rosefinch (2025) | 15 <i>Carpodacus rubicilla</i> , Great Rosefinch (2027) |
| 7 <i>Carpodacus vinaceus</i> , Vinaceous Rosefinch (2017a) | 16 <i>Carpodacus puniceus</i> , Redbreasted Rosefinch (2031) |
| 8 <i>Carpodacus rhodopeplus</i> , Spottedwinged Rosefinch (2019) | 17 <i>Loxia curvirostra</i> , Crossbill (2032) |
| 9 <i>Carpodacus trifasciatus</i> , Threebanded Rosefinch (2026) | |

PLATE 103

- 1 *Indicator xanthonotus*, Honeyguide (794)
- 2 *Haematospiza sipahi*, Scarlet Finch (2034)
- 3 *Callacanthis burtoni*, Redbrowed Finch (1997)
- 4 *Pyrrhula nipalensis*, Brown Bullfinch (2036)
- 5 *Pyrrhula aurantiaca*, Orange Bullfinch (2040)
- 6 *Pyrrhula erythrocephala*, Redheaded Bullfinch (2039)
- 7 *Pyrrhula erythaca*, Beavan's Bullfinch (2038)
- 8 *Coccothraustes coccothraustes*, Hawfinch (1981)
- 9 *Coccothraustes icteroides*, Black-and-Yellow Grosbeak (1982)
- 10 *Coccothraustes affinis*, Allied Grosbeak (1983)
- 11 *Coccothraustes melanozanthos*, Spottedwinged Grosbeak (1986)
- 12 *Pyrrhoptes epauletta*, Goldheaded Black Finch (2035)
- 13 *Coccothraustes carripes*, Whitewinged Grosbeak (1985)
- 14 *Melophus lathami*, Crested Bunting (2060)

PLATE 104

- | | |
|--|---|
| 1 <i>Emberiza calandra</i> , Corn Bunting (2041) | 9 <i>Emberiza pusilla</i> , Little Bunting (2056) |
| 2 <i>Emberiza citrinella</i> , Yellowhammer (SE) | 10 <i>Emberiza fucata</i> , Greyheaded Bunting (2055) |
| 3 <i>Emberiza leucocephalos</i> , Pine Bunting (2042) | 11 <i>Emberiza aureola</i> , Yellowbreasted Bunting (2046) |
| 4 <i>Emberiza buechanani</i> , Greynecked Bunting (2050) | 12 <i>Emberiza melanocephala</i> , Blackheaded Bunting (2043) |
| 5 <i>Emberiza stewarti</i> , Whitecapped Bunting (2048) | 13 <i>Emberiza rutila</i> , Chestnut Bunting (2045) |
| 6 <i>Emberiza cia</i> , Rock Bunting (2052) | 14 <i>Emberiza spodocephala</i> , Blackfaced Bunting (2047) |
| 7 <i>Emberiza hortulana</i> , Ortolan Bunting (2049) | 15 <i>Emberiza schoeniclus</i> , Reed Bunting (2058) |
| 8 <i>Emberiza striolata</i> , Striolated Bunting (2057) | 16 <i>Emberiza bruniceps</i> , Redheaded Bunting (2044) |

INDEX TO THE VOLUMES BY FAMILY *English names (for Latin names see front endpaper)*

- | | |
|------------------------------|------------------------|
| Accentors, 9 | Heron, 1 |
| Avadavat, 10 | Honeyguides, 4 |
| Avocet, 2 | Hoopoes, 4 |
| | Hornbills, 4 |
| Babblers, 6-7 | House Sparrows, 10 |
| Barbets, 4 | Hypocolius, 5 |
| Barn Owls, 3 | |
| Bee-eaters, 4 | Ibisbill, 2 |
| Bitterns, 1 | Ibises, 1 |
| Boobies, 1 | Ioras, 6 |
| Broadbills, 4 | |
| Bulbuls, 6 | Jaçanas, 2 |
| Buntings, 10 | Jaegers, 3 |
| Bustards, 2 | Jays, 5 |
| Button and Bustard-Quails, 2 | |
| | Kingfishers, 4 |
| Chaffinch, 10 | |
| Chats, 8-9 | Larks, 5 |
| Coots, 2 | Laughing Thrushes, 7 |
| Cormorants, 1 | Leaf Birds, 6 |
| Couriers, 3 | Leaf Warblers, 8 |
| Crab Plover, 2 | Longtailed Titmice, 9 |
| Cranes, 2 | Loons, 1 |
| Creepers, 9 | |
| Crested Swift, 4 | Magpies, 5 |
| Crows, 5 | Megapodes, 2 |
| Cuckoo-Shrikes, 6 | Minivets, 6 |
| Cuckoos, 3 | Monarch Flycatchers, 7 |
| Curlews, 2 | Munias, 10 |
| | Mynas, 5 |
| Darter, 1 | |
| Dippers, 9 | Nightjars, 4 |
| Divers, 1 | Nuthatches, 9 |
| Doves, 3 | |
| Drongos, 5 | Orioles, 5 |
| Ducks, 1 | Owls, 3 |
| | Oystercatchers, 2 |
| Egrets, 1 | |
| Fairy Bluebird, 6 | Painted Snipe, 2 |
| Falcons, 1 | Parrots, 3 |
| Finches, 10 | Partridges, 2 |
| Finfoot, 2 | Pelicans, 1 |
| Flamingos, 1 | Penduline Titmice, 9 |
| Flowerpeckers, 10 | Petrels, 1 |
| Flycatchers, 7 | Phalaropes, 2 |
| Frigate Birds, 1 | Pheasants, 2 |
| Frogmouths, 4 | Pigeons, 3 |
| | Pipits, 9 |
| Greese, 1 | Pittas, 4 |
| Goatsuckers, 4 | Plovers, 2 |
| Goldfinches, 10 | Pratincoles, 3 |
| Grebes, 1 | |
| Grey Creeper, 9 | Quails, 2 |
| Gulls, 3 | |
| | Rails, 2 |
| Hawks, 1 | Robins, 8 |
| Hedge Sparrows, 9 | Rollers, 4 |

Sandgrouse, 3
Sandpipers, 2
Scimitar Babblers, 6
Shearwaters, 1
Shrikebilled Flycatcher, 7
Shrikes, 5
Skuas, 3
Snipe, 2
Sparrows, 10
Spiderhunters, 10
Spoonbill, 1
Spotted Creepers, 9
Starlings, 5
Stilts, 2
Stone Curlews, 3
Storks, 1
Storm Petrels, 1
Sunbirds, 10
Swallow-Shrikes, 5
Swallows, 5
Swans, 1
Swifts, 4
Terns, 3

Thick-knees, 3
Thickhead, 7
Thrushes, 8-9
Tits, 9
Titmice, 9
Tree Creepers, 9
Trogon, 4
Tropic-birds, 1

Vultures, 1

Wagtails, 9
Wall Creeper, 9
Warblers, 8
Waxbills, 10
Waxwing, 5
Weaver Birds, 10
White-eyes, 10
Wood Swallows, 5
Woodcock, 2
Woodpeckers, 4
Wrens, 9
